
Women's Interagency HIV Study

October 2018

This slide set summarizes key study characteristics and scientific contributions of the WIHS.

Prepared by:

WIHS Data Management and Analysis Center (WDMAC)

Women's Interagency HIV Study (WIHS) Sites

WIHS Sites and Principal Investigators

▶ **Consortia:**

- Atlanta, Georgia (*I. Ofotokun, G. Wingood, A. Sheth*)
- Birmingham, Alabama/Jackson, Mississippi (*M. Kempf, D. Konkle-Parker*)
- Bronx, New York (*K. Anastos, A. Sharma*)
- Brooklyn, New York (*H. Minkoff, D. Gustafson, T. Wilson*)
- Chapel Hill, North Carolina (*A. Adimora*)
- Chicago, Illinois (*M. Cohen, A. French*)
- Los Angeles, California (*J. Milam*)
- Miami, Florida (*M. Fischl, M. Alcaide, D. Jones Weiss*)
- Northern California (*R. Greenblatt, P. Tien, B. Aouizerat*)
- Washington, D.C. (*S. Kassaye, D. Merenstein*)

▶ **Data Coordinating Center (WDMAC):**

- Johns Hopkins University, Baltimore, Maryland (*S. Gange, E. Golub*)

WIHS Sponsoring Institutions (Program Officers)

- ▶ **National Institute of Allergy and Infectious Diseases (J. Roe)**
 - National Cancer Institute (*G. Dominguez*)
 - *Eunice Kennedy Shriver National Institute of Child Health and Human Development (D. Russo)*
 - National Institute on Drug Abuse (*R. Jenkins*)
 - National Institute of Mental Health (*D. Colosi*)

WIHS Operational Groups

- ▶ Executive Committee
- ▶ Data Management
- ▶ Laboratory / Specimen
- ▶ National Community Advisory Board
- ▶ Project Directors
- ▶ WIHS Specimen Allocation Committee

Areas of Focused Scientific Research in WIHS-V

- ▶ Aging
- ▶ Behavior & Substance Use
- ▶ Cancer/Pathology
- ▶ Cardiovascular
- ▶ Epidemiology
- ▶ Female Genital Tract & Pathogenesis
- ▶ Genomics
- ▶ Gynecology
- ▶ Hepatitis & Liver Disease
- ▶ Human Papillomavirus
- ▶ Metabolics
- ▶ Neurocognition
- ▶ Pharmacokinetics & Antiretroviral Exposure
- ▶ Pregnancy
- ▶ Pulmonary
- ▶ Renal

WIHS Major Substudies

- ▶ **DATRII oog:** HIV-1 in vaginocervical secretions
- ▶ **NIDA Health Care Utilization:** Influence of drug use on utilization of health care
- ▶ **NIDA Immunology/Virology:** Influence of drug use on HIV-1 natural history
- ▶ **Oral:** Oral lesions, periodontal disease, salivary assessment
- ▶ **HHV8:** HHV-8 shedding in saliva and cervico-vaginal fluid
- ▶ **Viral Resistance:** Retrospective and prospective studies of viral resistance and rebound
- ▶ **Anal HPV:** Anal HPV infection and development and progression of ASIL in the era of HAART

WIHS Major Substudies

- ▶ ***Metabolic Toxicities***: Cross-sectional assessment of metabolic abnormalities, fat redistribution, osteoporosis, osteopenia, and protease inhibitor exposure
- ▶ ***Intensive Pharmacokinetics (PK)***: Bioavailability and clearance rates for selected target antiretroviral medications (WIHS-III: Viracept, Kaletra, Reyataz, Sustiva, Viramune; WIHS-IV: Isentress)
- ▶ ***Prospective Metabolic***: Prospective assessment of metabolic complications in pre- versus post-menopausal women as determined via DXA scan, oral glucose tolerance testing (GTT), NMR LipoProtein, and MRI

WIHS Major Substudies

- ▶ ***Sex Steroid***: Effect of HIV infection on age of onset of diminished ovarian reserve
- ▶ ***Cardiovascular Disease***: Assessment of aspects of cardiovascular disease among HIV+ and HIV- women, including cardiovascular risk factors, carotid artery intima-media thickness (CIMT), and clinical cardiovascular events
- ▶ ***Neurocognition WIHS-III***: Interaction between aging and HIV/AIDS on neurocognitive functioning among HIV+ and HIV at-risk women
- ▶ ***Physical Functioning***: Cross-sectional assessment to identify and characterize physical impairment and frailty among HIV+ and HIV at-risk women

WIHS Major Substudies

- ▶ ***Genetics and Disease Progression:*** Interaction between genetic factors, substance abuse, mood, cognitive impairment, and progression of HIV disease
- ▶ ***Neurocognition WIHS-IV & V:*** Administration of a Neurocognitive Battery to assess stress, activities of daily living, cognition and functional ability
- ▶ ***MALT / GALT:*** Effects of HIV infection in gut-associated lymphoid tissue (GALT) and endometrial mucosal-associated lymphoid tissue (MALT) in HIV+ and HIV-women at selected stages of HIV disease progression
- ▶ ***Musculoskeletal Substudy:*** Assessment of women undergoing the menopausal transition with detailed musculoskeletal studies performed using DXA scanning, Quantitative CT and functional performance tests

WIHS Major Substudies

- ▶ ***Geocoding:*** Evaluate the relationship between virologic suppression and serious AIDS-defining events, blood pressure control, and mortality and the proportion of the population below the federal poverty line in each participant's census block group, income inequality in each participant's county, and each participant's health insurance status
- ▶ ***Cervical Cancer Screening Substudy (CCSS):*** Compare the accuracy of different molecular assays for cervical cancer screening
- ▶ ***Arterial Brachial Index Measurement:*** Measure peripheral arterial disease (PAD) using the ankle brachial index (ABI) to determine the factors associated with PAD and its progression

WIHS Major Substudies

- ▶ ***Liver Disease and Reproductive Aging (LIVRA) Study:*** Study to examine the association of HIV, HCV, the menopausal transition and associated metabolic and inflammatory mediators with liver steatosis and liver fibrosis progression
- ▶ ***Immunologic and Clinical Consequences of Hepatitis C Cure:*** Characterization of the effect of HCV cure on neurocognitive consequences, and on markers of monocyte/macrophage activation
- ▶ ***Frailty Study:*** Assessment to characterize and track potential changes in physical impairment and frailty among HIV+ and HIV at-risk women

WIHS Major Substudies

- ▶ ***Electrocardiogram Study:*** Study to determine whether HIV infection leads to abnormal cardiac autonomic function and results in more common ECG derangements, and that HIV-specific factors associated with poorer control or specific medications heighten such aberrations
- ▶ ***Echocardiography Study:*** Study to determine whether HIV infection leads to abnormal cardiac structure and function, and that HIV-specific factors associated with poorer control or specific medications amplify such abnormalities
- ▶ ***Lung Function Study:*** Exploration of lung function to better understand how lung disease develops in people with HIV and to identify targets for disease prevention and management

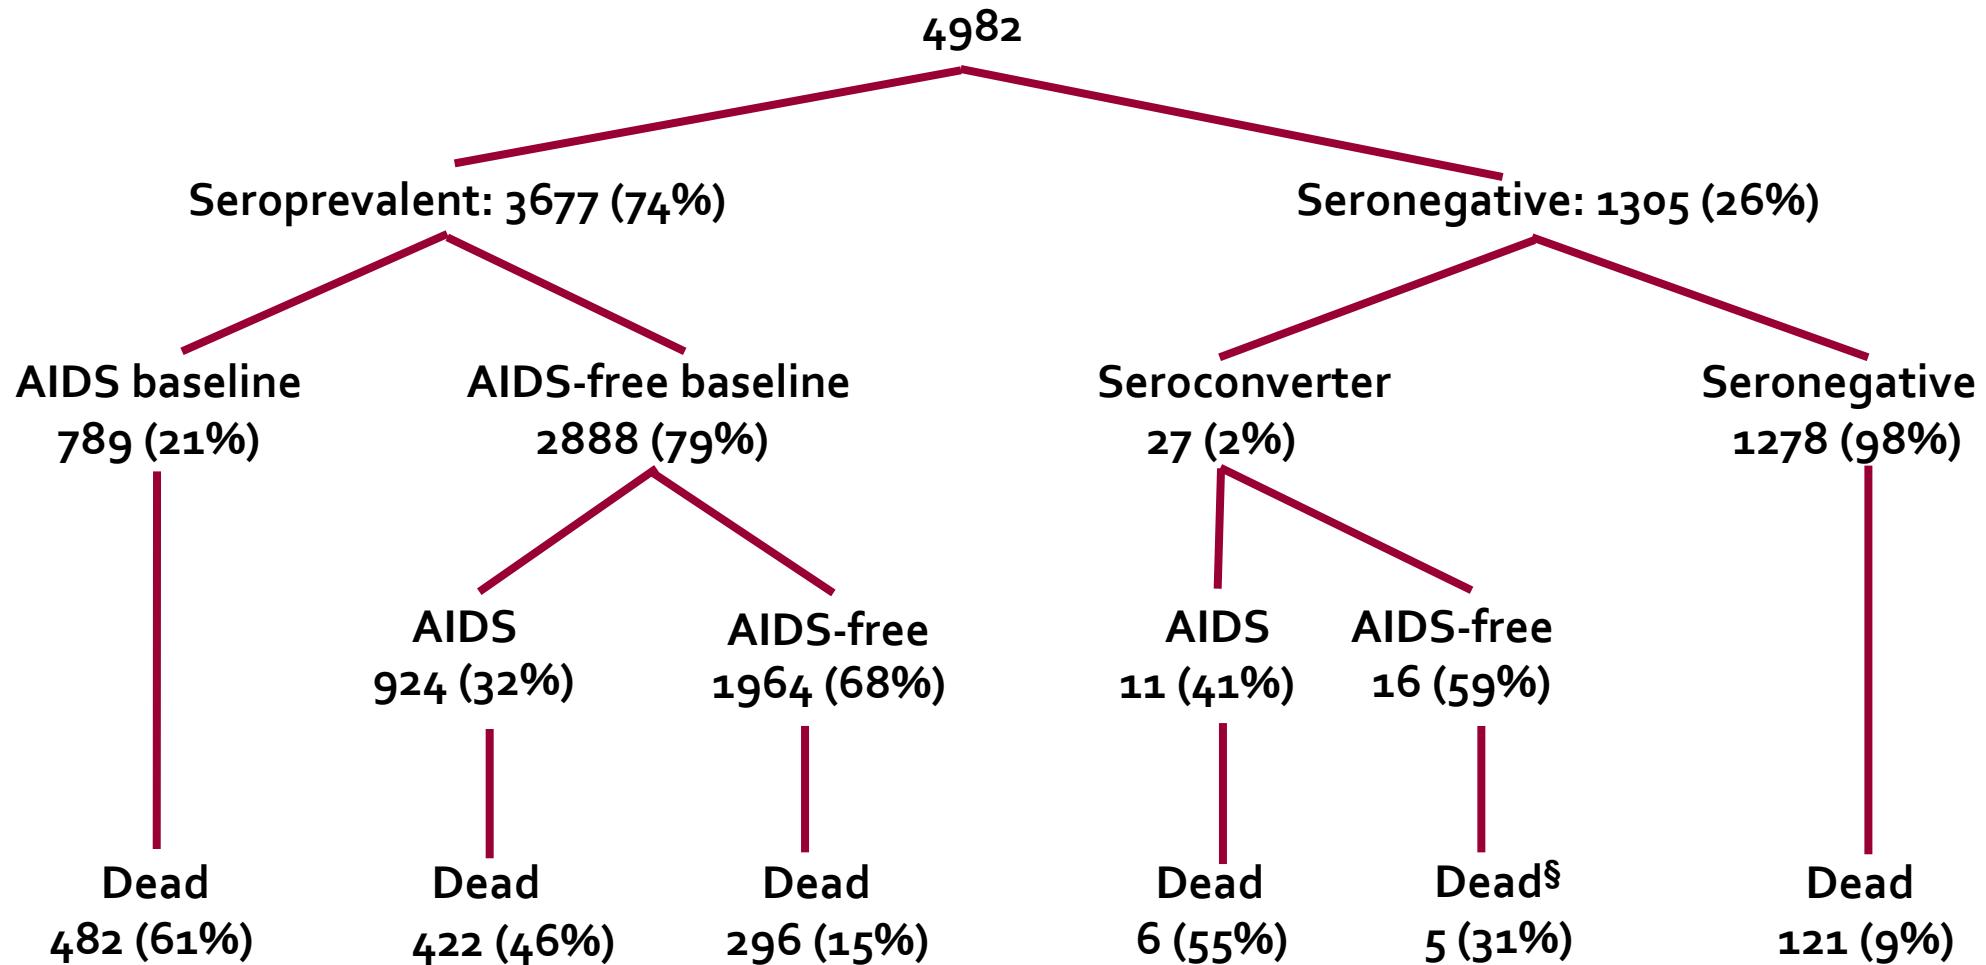

Semi-Annual Visit

- ▶ Interviewer-administered Questionnaires:
 - Behavior
 - Health Services
 - Medical and OB/GYN History
 - Demographics/Psychosocial
- ▶ Physical and Gynecological Examination
- ▶ Annual Lipodystrophy Exam (body measures, BIA)
- ▶ Medication use (ART, OI prophylaxis, hepatitis, etc.)
- ▶ Participant Samples:
 - Blood (virologic, immunologic, fasting metabolic markers, liver/renal function, etc.)
 - Other (CVL, saliva, urine)
 - Local and National Repositories

Continuous Outcome Ascertainment

- ▶ Seroconversion
- ▶ Clinical Outcomes:
 - AIDS Diagnoses
 - Malignancies
 - Mortality
 - Tuberculosis
 - Hospitalizations
 - CVD Events
- ▶ Sources:
 - Self-report
 - Medical Record Abstraction (for selected outcomes only)
 - Registry Match
 - Cancer
 - Tuberculosis
 - National Death Index - Plus

WIHS Cohort*

* HIV & AIDS status as of the end of visit 47 (3/31/18). Deaths via NDI (through 12/31/14 for site 4 & 12/31/16 for all other sites) and through 3/31/18 via other reports

§ Three seroconverters found at death

WIHS Cohort by Enrollment Wave

	WIHS I 1994-95 N=2623 (53%)	WIHS II 2001-02 N=1143 (23%)	WIHS IV 2011-12 N=371 (7%)	WIHS V 2013-15 N=845 (17%)
HIV Serostatus at Baseline				
Seronegative	569 (22)	406 (36)	95 (26)	234 (28)
Seropositive				
Therapy-naïve	2054 (78)	255 (22)	78 (21)	92 (11)
Therapy-exp'd	--	482 (42)	198 (53)	519 (61)
Current Cohort ^a (N=2259)	678 (30%)	550 (24%)	272 (12%)	759 (34%)

^a Current cohort = All participants seen at Visit 46 or 47

Baseline Characteristics

(Barkan, Melnick, . . . , Feldman, *Epidemiology* 1998; 9:117-125)^a

	94/95 Cohort		01/02 Cohort	
	HIV+	HIV-	HIV+	HIV-
Median age	36	34	33	29
Race/ethnicity				
African-American	56%	54%	60%	61%
Latina	23%	28%	32%	28%
Exposure Category				
Intravenous drug use	34%	28%	10%	13%
Heterosexual sex	42%	26%	41%	24%
Transfusion risk	4%	3%	-- ^b	-- ^b
No identified risk	20%	43%	48%	63%

^a 01/02 cohort data added ^b Transfusion risk not assessed in 01/02 cohort

Baseline Characteristics

(Barkan, Melnick, . . . , Feldman, *Epidemiology* 1998; 9:117-125)^a

	94/95 Cohort		01/02 Cohort	
	HIV+	HIV-	HIV+	HIV-
Employed	21%	29%	34%	40%
Median per capita household income	\$4,500	\$5,000	\$4,500	\$4,500
No health insurance	18%	41%	15%	39%
History of physical/sexual abuse	66%	67%	9% ^b	16% ^b
Median CD4+ count (cells/mm³)	330	1,028	493	984
Median viral load (copies/ml, NASBA assay)	22,000	---	610	---

^a 01/02 cohort data added

^b Assessed only in 6 months prior to enrollment

Baseline Characteristics

(Bacon, Von Wyl, . . . , Young, CDLI 2005; 12:1013-1019)

	94/95 Cohort		01/02 Cohort	
	HIV+	HIV-	HIV+	HIV-
Completed high school	63%	63%	60%	65%
Single mother	28%	21%	37%	32%
Below poverty line	46%	54%	52%	51%
Unstable housing situation	13%	21%	7%	16%
HAART use	0	---	66%	---
Clinical AIDS	34%	---	3%	---

Baseline Characteristics

(Bacon, Von Wyl, . . . , Young, *CDLI* 2005; 12:1013-1019)

Parameter or Condition	Percent with Comorbidity	
	94/95 Cohort	01/02 Cohort
HBV core antibodies	43%	19%
HBV surface antigen	2.6%	1.4%
HCV antibodies	39%	13%
SIL on Pap test*	13%	8%
Diabetes	4.4%	4.6%
Hypertension	17%	12%
Obesity	53%	65%
Smoking	58%	42%

* Low-grade SIL, high-grade SIL, or carcinomas were detected *in situ* on initial Pap smear

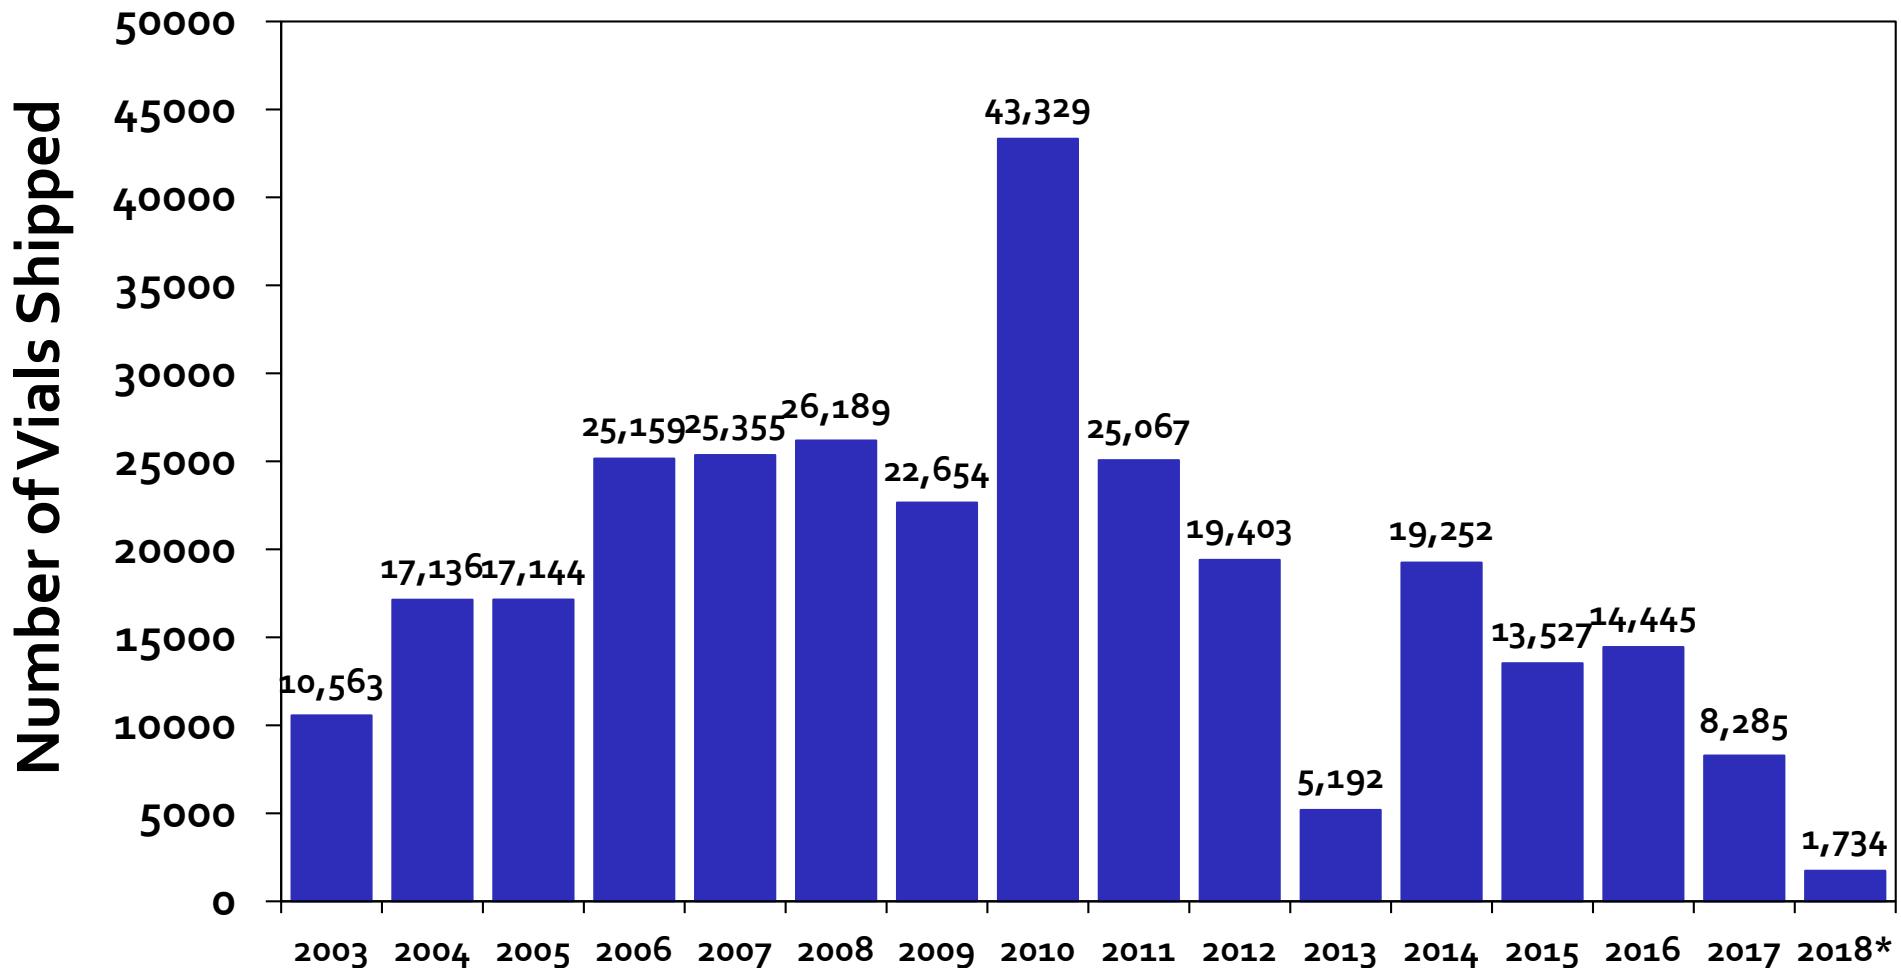

HBV, hepatitis B virus; HCV, hepatitis C virus; SIL, squamous intraepithelial lesion

WIHS Database (as of 3/31/18)

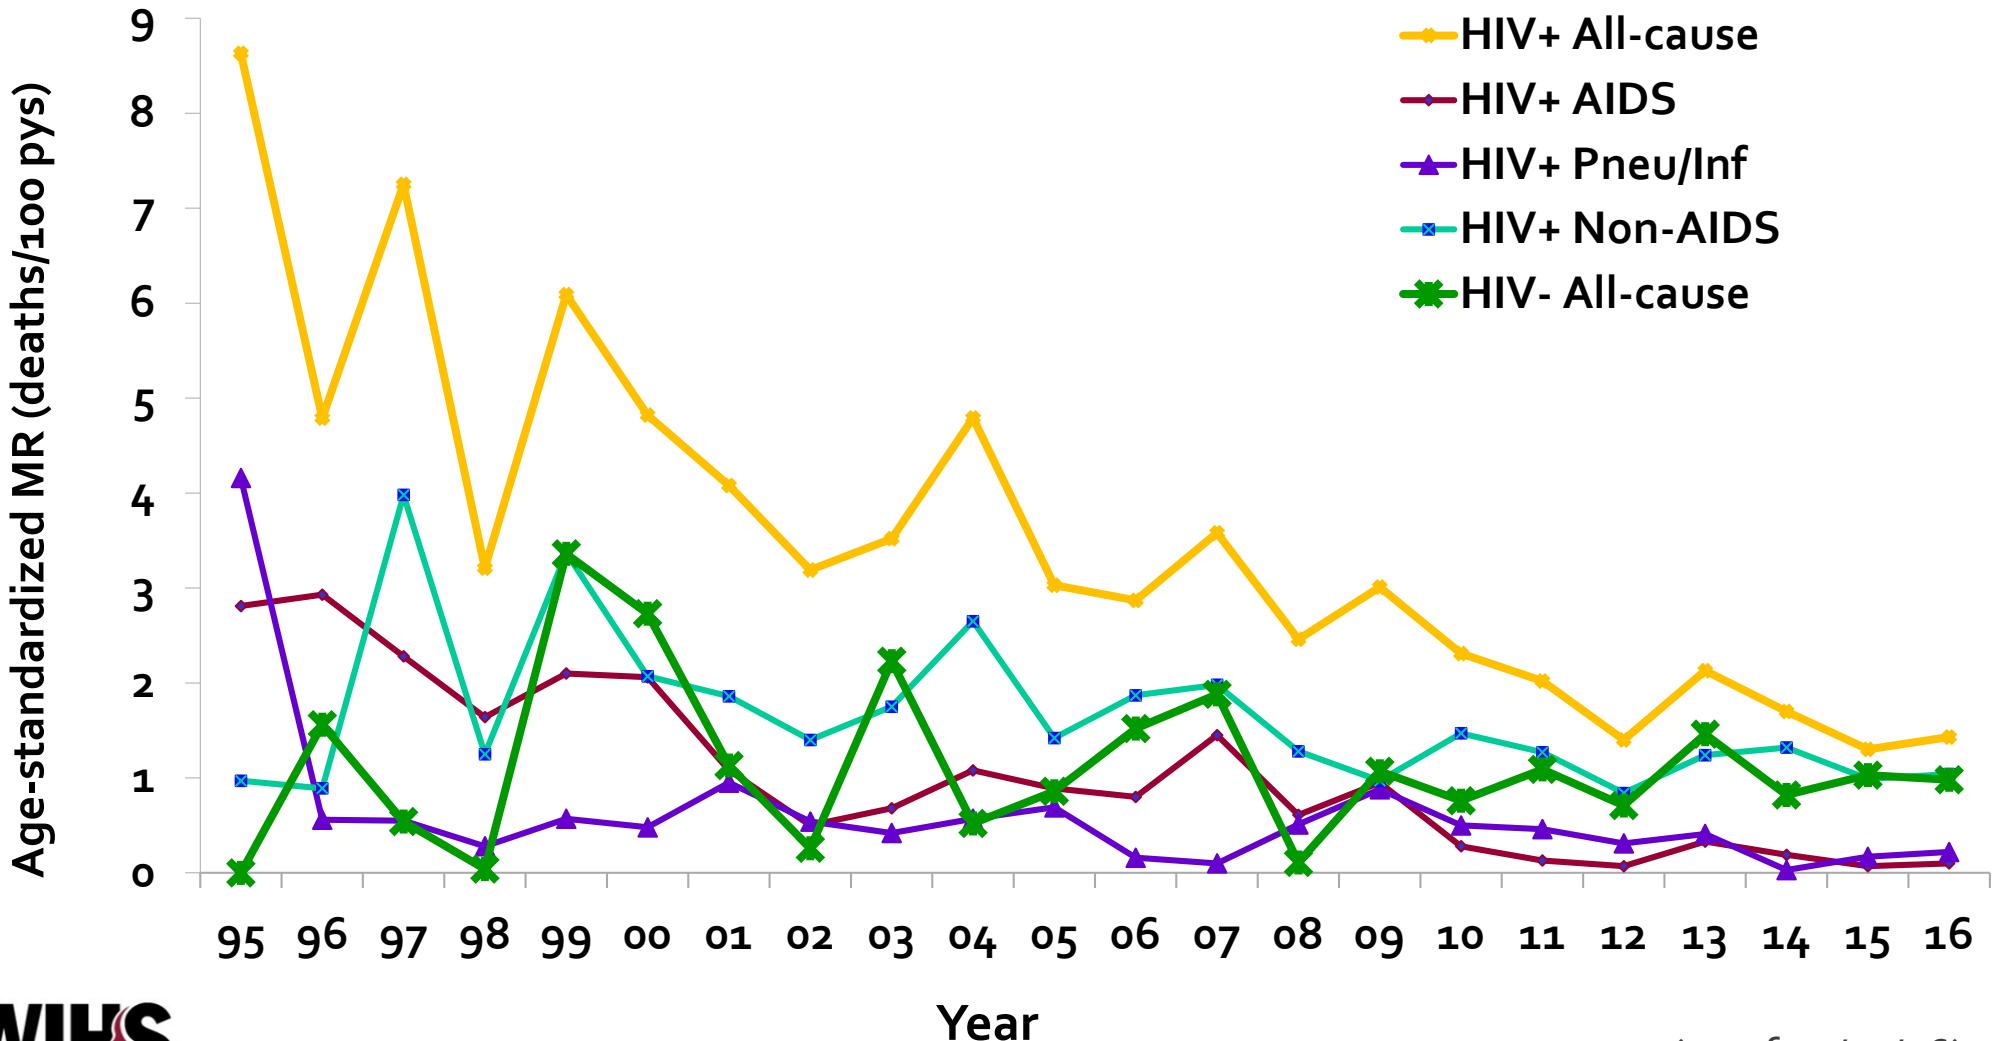

Total number of PARTICIPANTS enrolled	3,701	HIV+
	1,281	HIV-
Total number of PERSON-YEARS	36,765	HIV+
	13,743	HIV-
Median (Mean) FOLLOW-UP TIME in years	13.35 (12.53)	WIHS I
	14.14 (11.51)	WIHS II
	5.90 (5.10)	WIHS IV
	3.25 (3.13)	WIHS V
Total number of PERSON-VISITS	69,536	HIV+

Vials Shipped from Precision Bioservices, 2003-2018

Change in Age-Adjusted 6-Month Mortality Rates

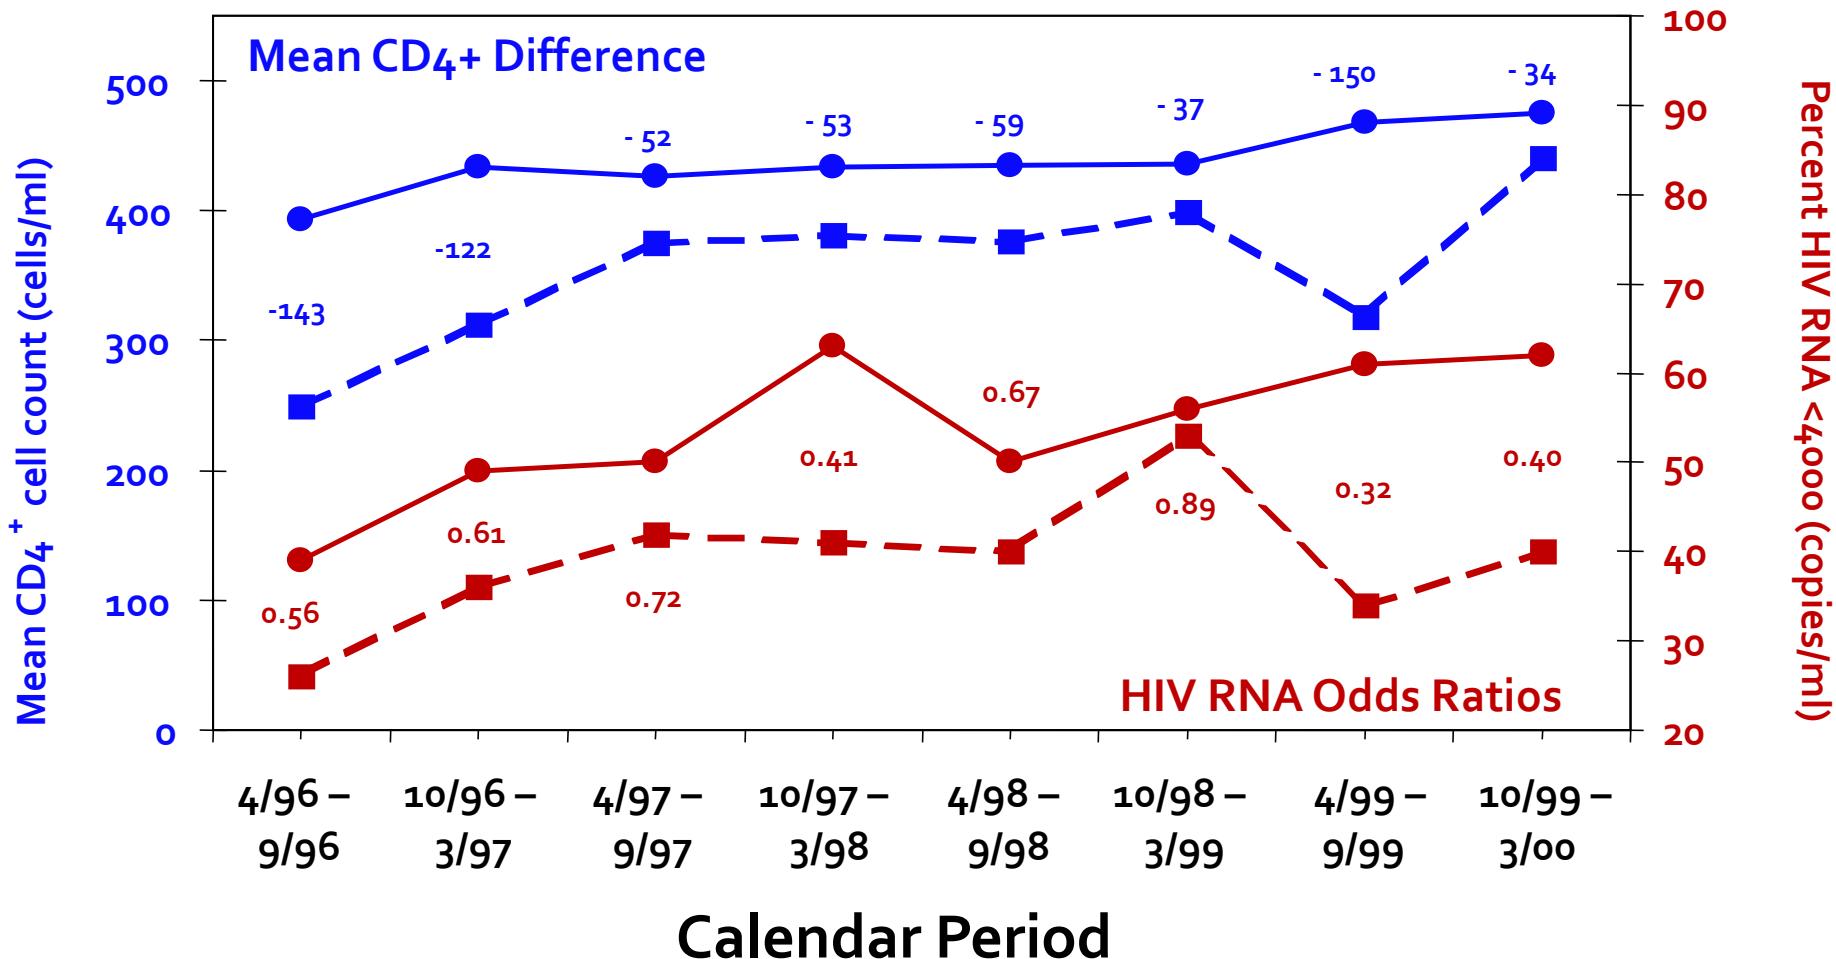

Antiretroviral Therapy Use Among WIHS HIV-infected Participants

*Summary of Selected
WIHS Publications*

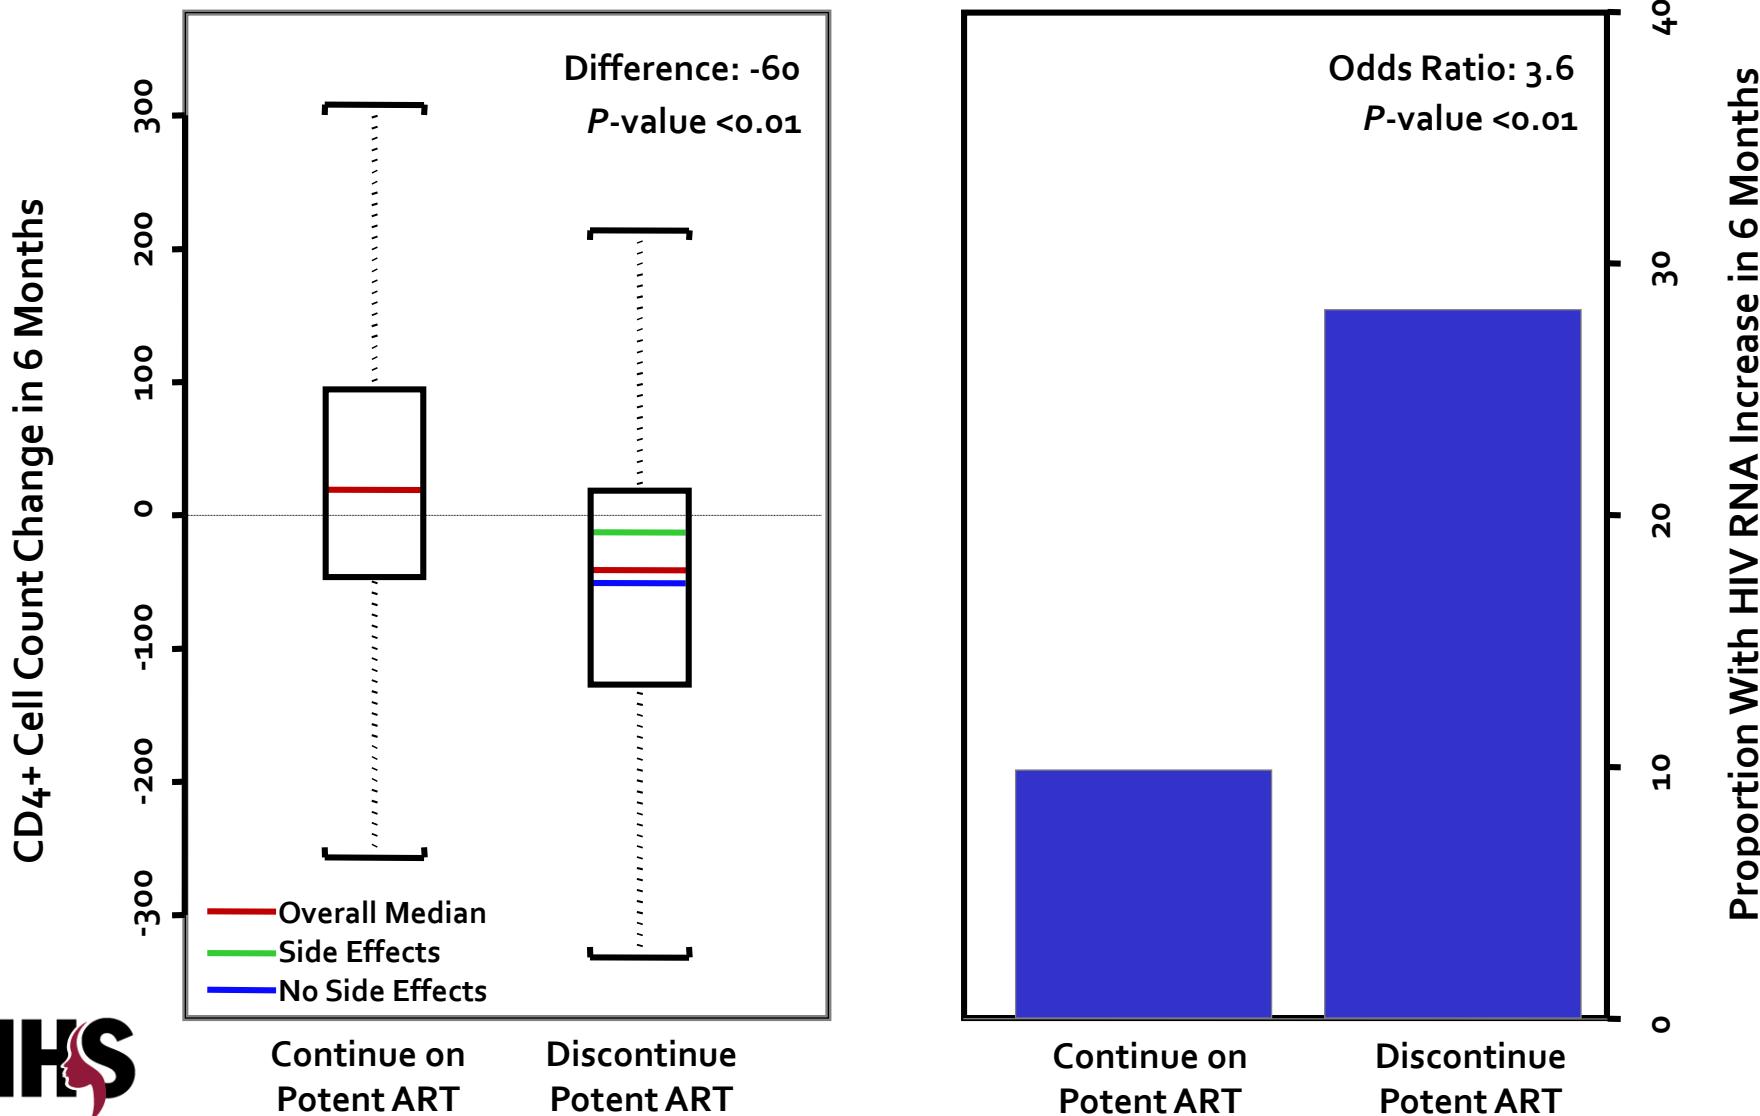

Selection by Indication for Potent ART Initiation

(Ahdieh, Gange, . . . , Muñoz, Am J Epidemiol 2000; 152:923-933)

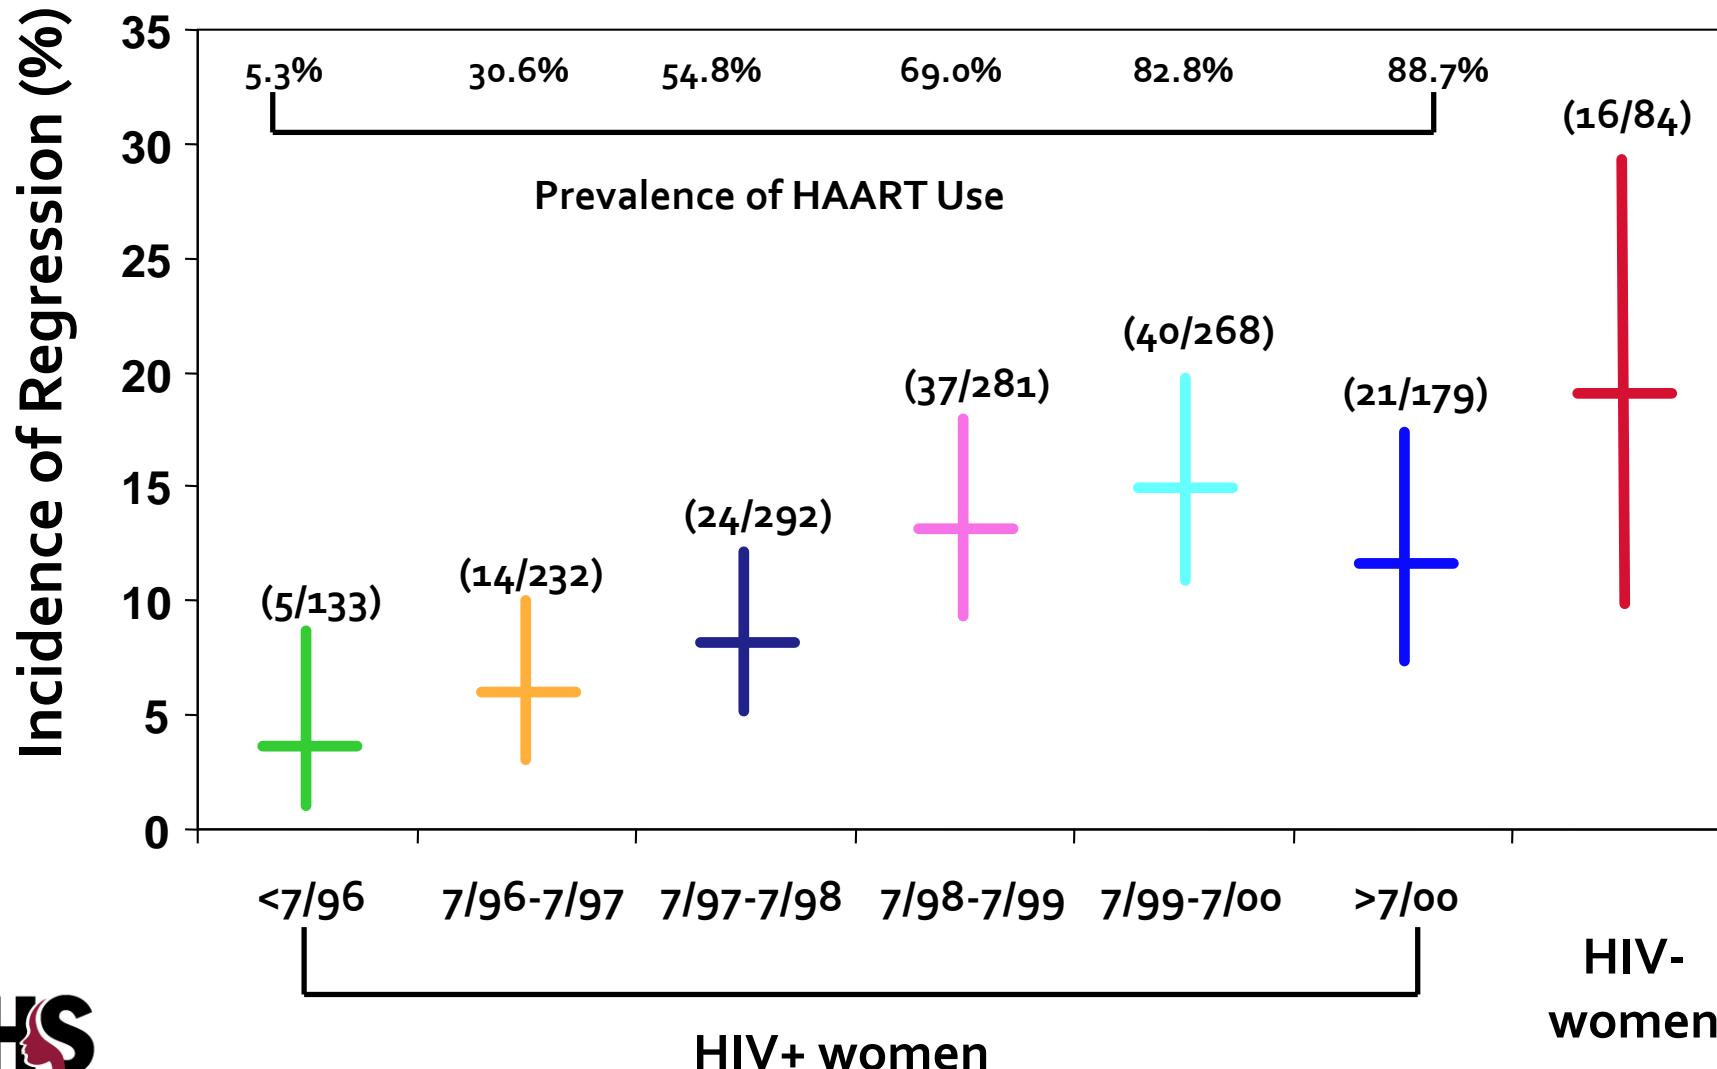

Short-term Consequences of Potent ART Discontinuation

(Ahdieh, Silverberg, . . . , Muñoz, AIDS 2001; 15:2101-2108)

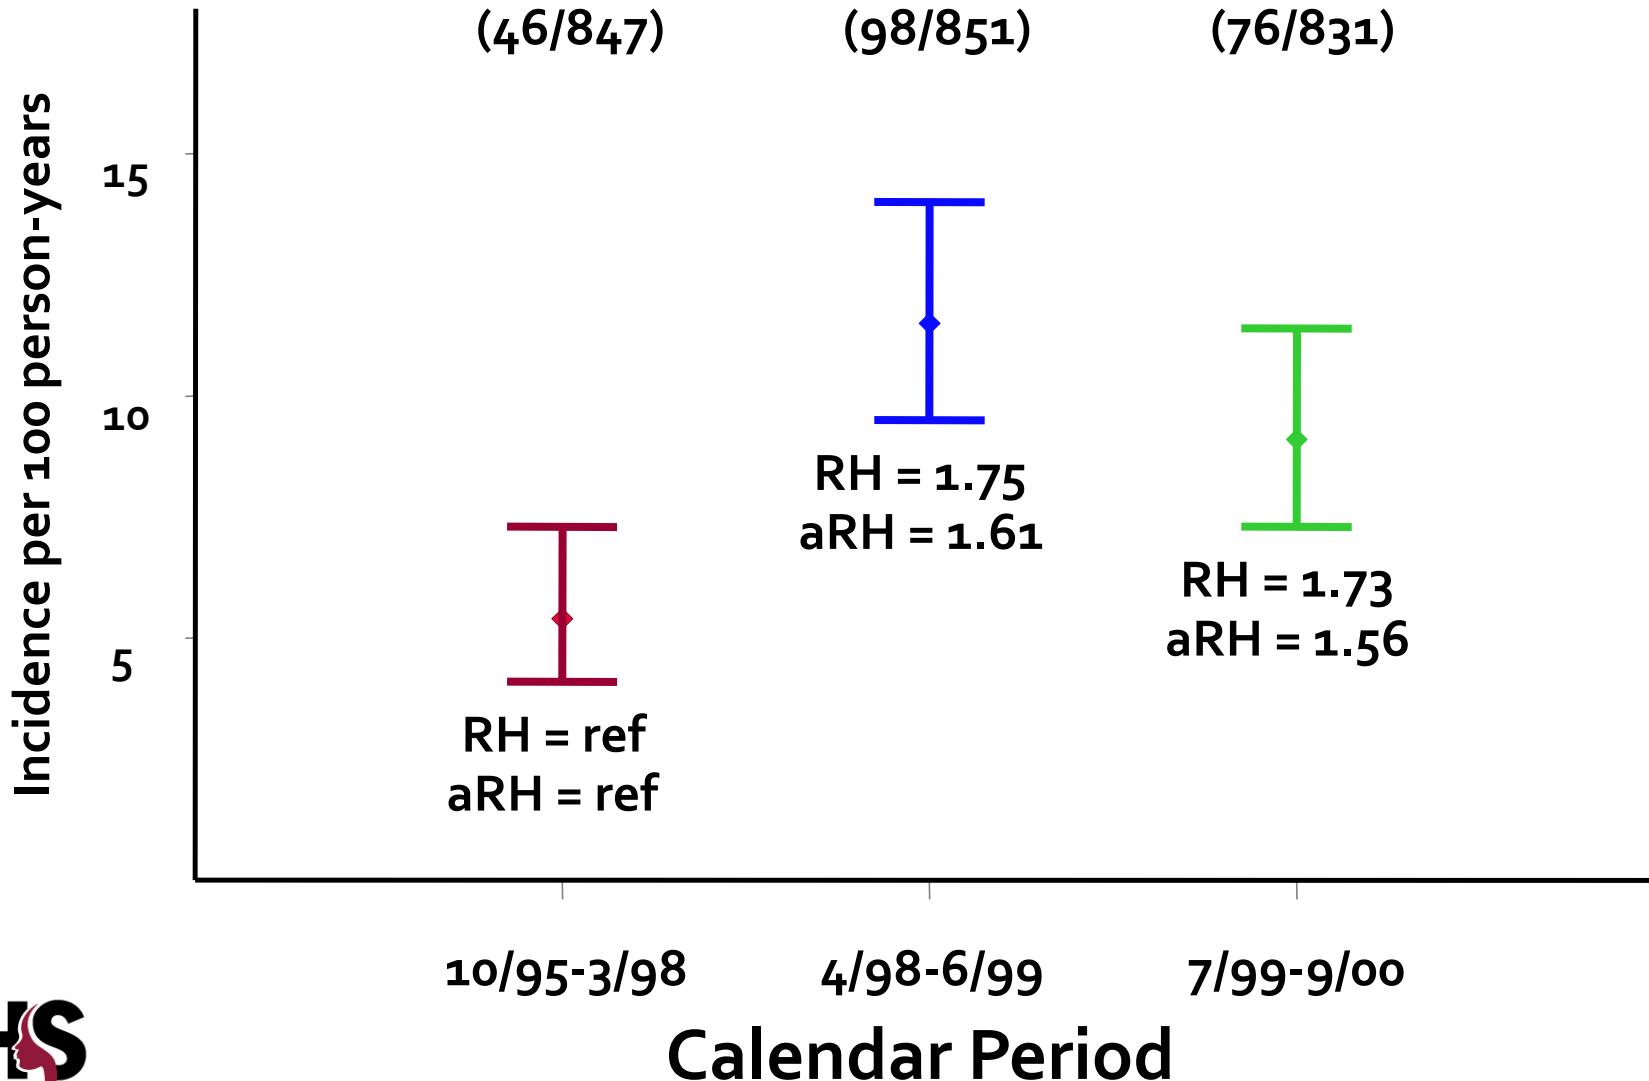

HAART and Cervical Squamous Intraepithelial Lesions in HIV+ Women

(Ahdieh-Grant, Li, . . . , Gange, *J Natl Cancer Inst* 2004; 96:1070-1076)

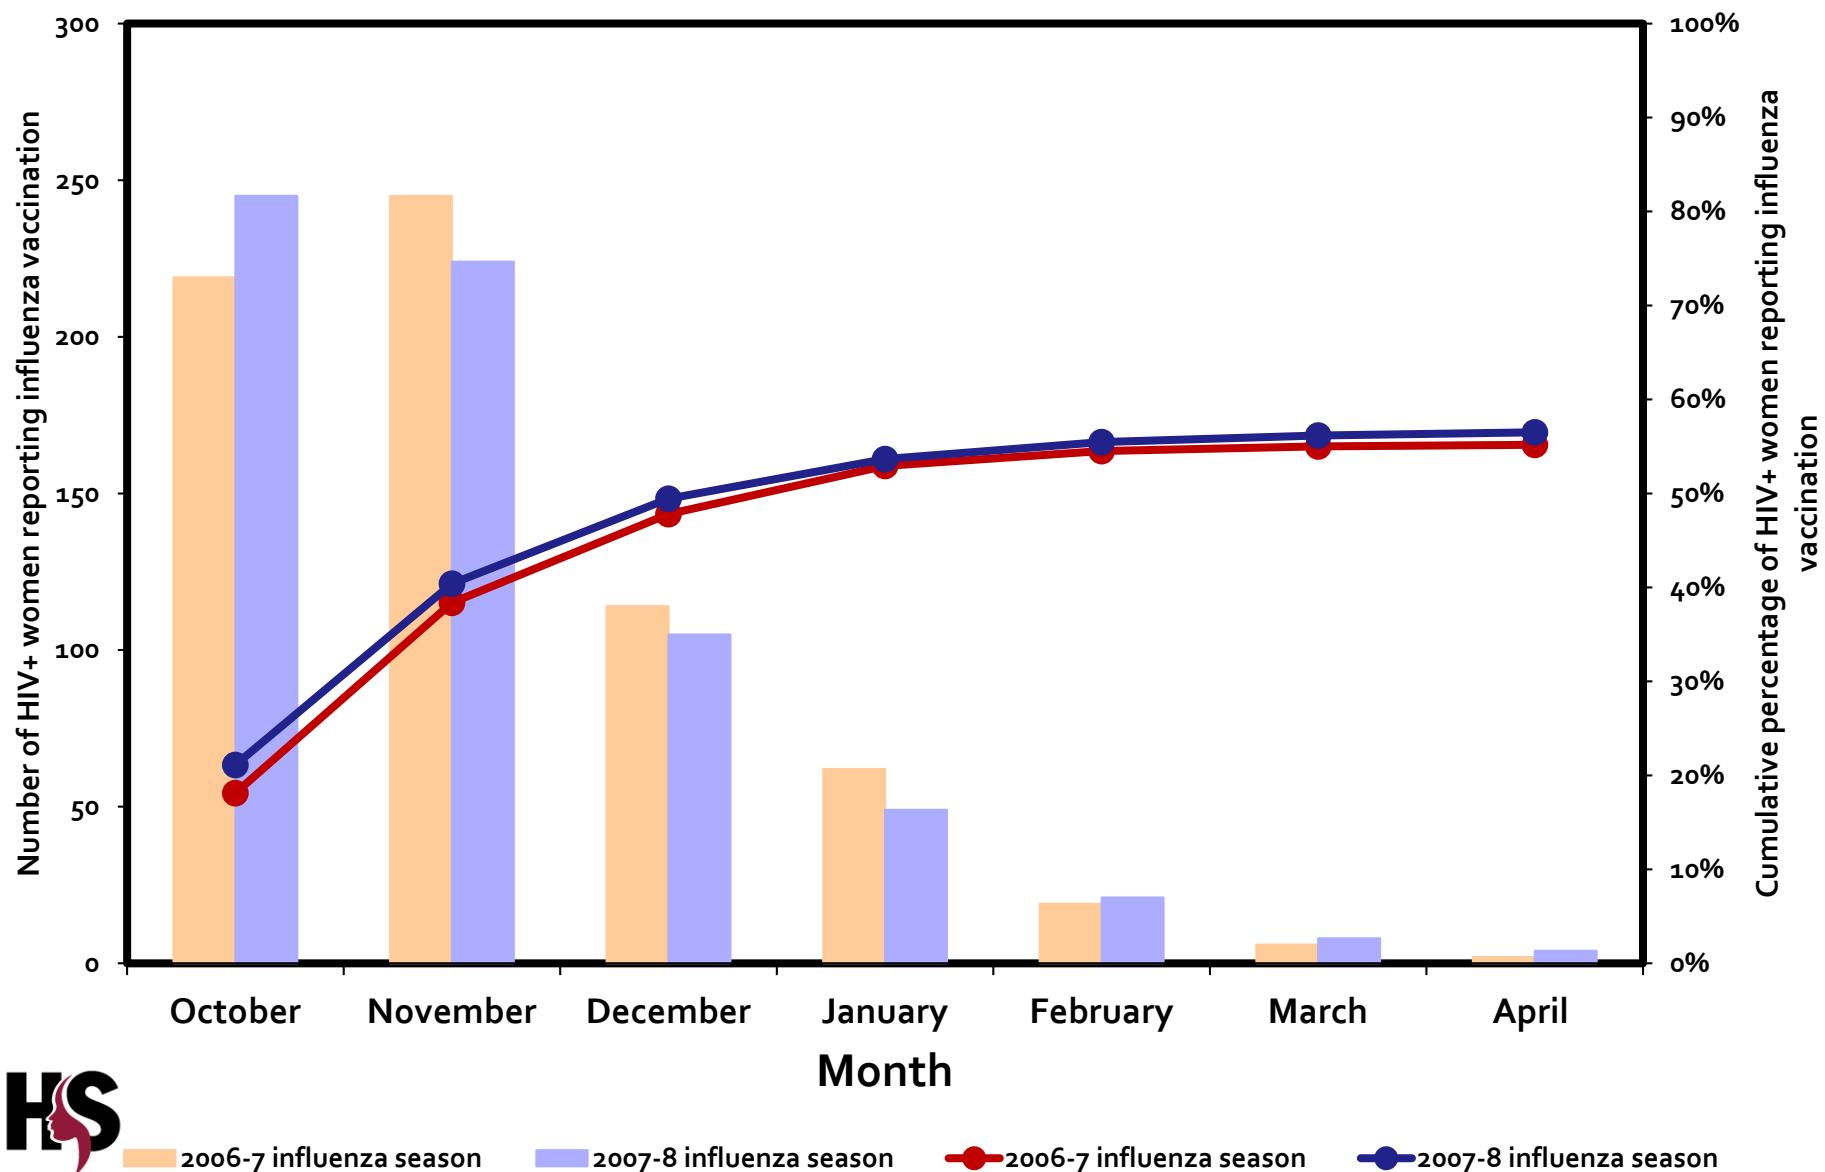

Incidence of HAART Discontinuation by Calendar Period

(Ahdieh-Grant, Tarwater, . . . , Greenblatt, *J Acquir Immune Defic Syndr* 2005; 38:500-503)

Influenza Vaccination of HIV-infected Women in WIHS

(Althoff, Anastos, . . . , Gange, Preventive Medicine 2010; 50:223-229)

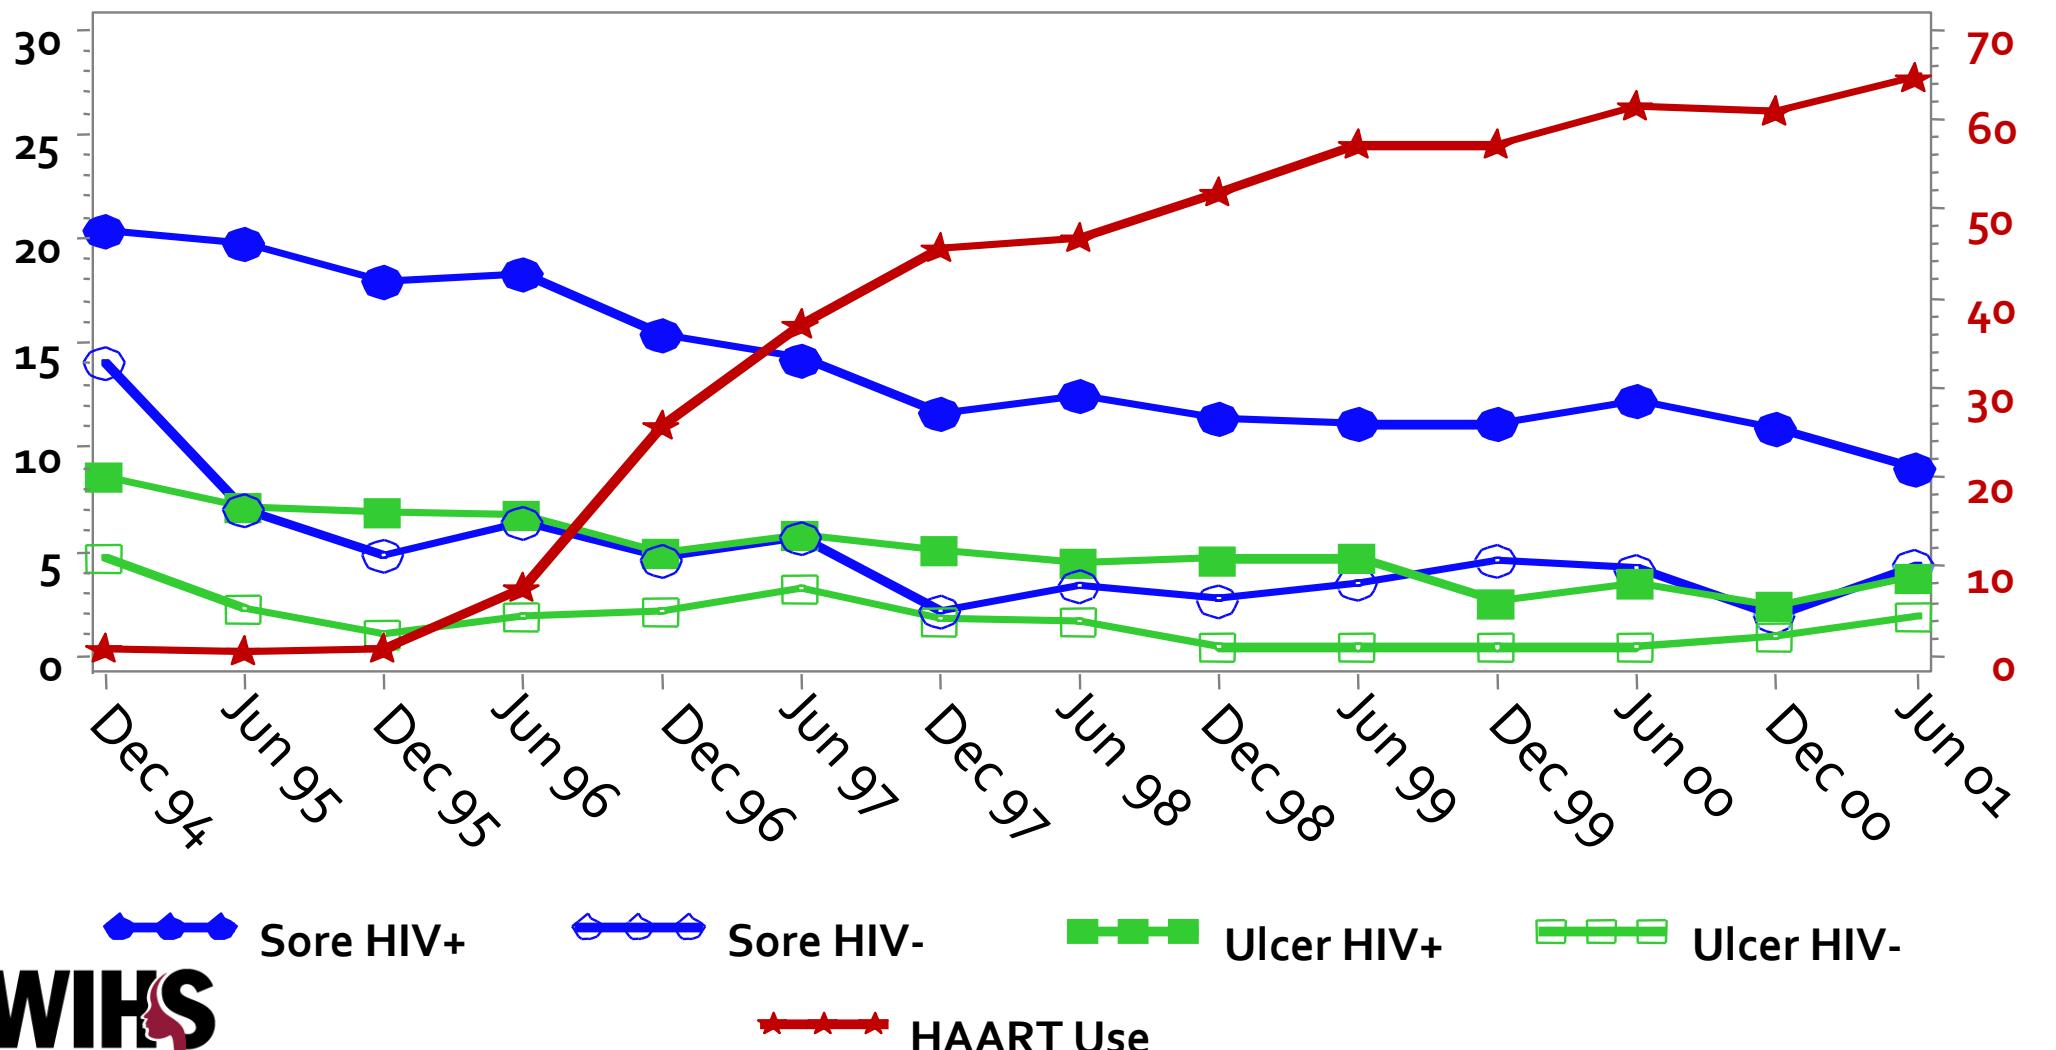

Incidence of Genital Lesions and HAART Use among HSV-2+ Women

(Ameli, Bacchetti, . . . , Greenblatt, AIDS 2006; 20:1051-1058)

% With Lesion

% On HAART

Relative Hazard of Death (all cause) after HAART

(Anastos, Barrón, . . . , Gange, *Ann Intern Med* 2004; 140:256-264)

	Relative Hazard for Death (95% CI)	
	Univariate	Multivariate ^a
Pre-HAART age, 10 yr increments	1.56 (1.29 – 1.90) ^b	1.61 (1.27 – 2.05) ^b
Pre-HAART CD4 cell count		
< 200 cells/mL	4.04 (2.47 – 6.59) ^b	1.09 (0.56 – 2.11)
200 – 350 cells/mL	1.75 (0.98 – 3.11)	1.04 (0.55 – 2.00)
> 350 cells/mL	Reference	Reference
Pre-HAART HIV-1 RNA level		
< 80 copies/mL	Reference	Reference
80 – 10,000 copies/mL	1.67 (0.51 – 5.51)	1.42 (0.43 – 4.77)
> 10,000 copies/mL	4.26 (1.35 – 13.44) ^b	1.95 (0.60 – 6.34)

^a Adjusted for pre-HAART and post-HAART variables.

^b Statistically Significant.

Relative Hazard of Death (all cause) after HAART

(Anastos, Barrón, . . . , Gange, *Ann Intern Med* 2004; 140:256-264)

	Relative Hazard for Death (95% CI)	
	Univariate	Multivariate ^a
Post-HAART CD4 cell count		
< 200 cells/mL	5.95 (3.83 – 9.24) ^b	2.66 (1.42 – 4.99) ^b
200 – 350 cells/mL	1.34 (0.73 – 2.44)	0.90 (0.45 – 1.81)
> 350 cells/mL	Reference	Reference
Post-HAART HIV-1 RNA level		
< 80 copies/mL	Reference	Reference
80 – 10,000 copies/mL	2.34 (1.18 – 4.62) ^b	1.81 (0.87 – 3.75)
> 10,000 copies/mL	7.53 (4.01 – 14.12) ^b	3.44 (1.67 – 7.09) ^b
AIDS before HAART initiation	3.12 (2.14 – 4.56) ^b	2.15 (1.41 – 3.28) ^b

^a Adjusted for pre-HAART and post-HAART variables.

^b Statistically Significant.

AIDS after HAART Initiation (94/95 cohort)

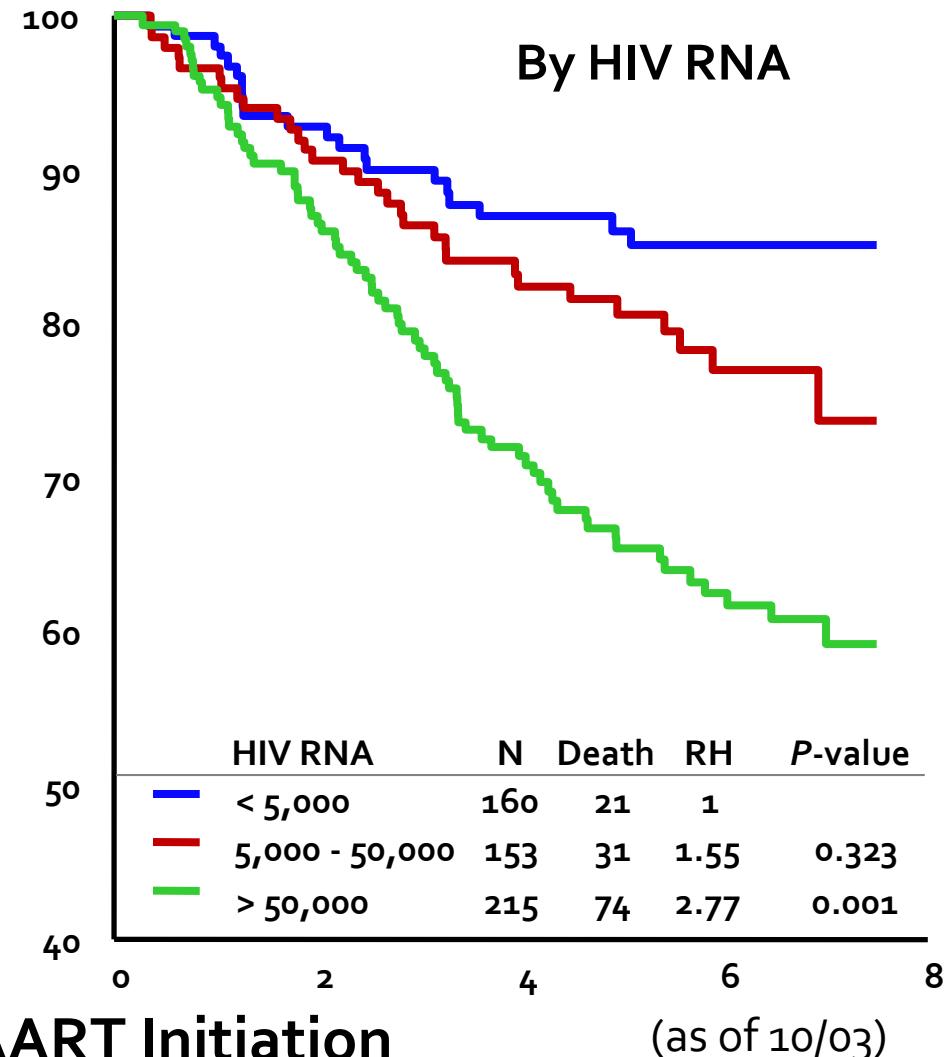

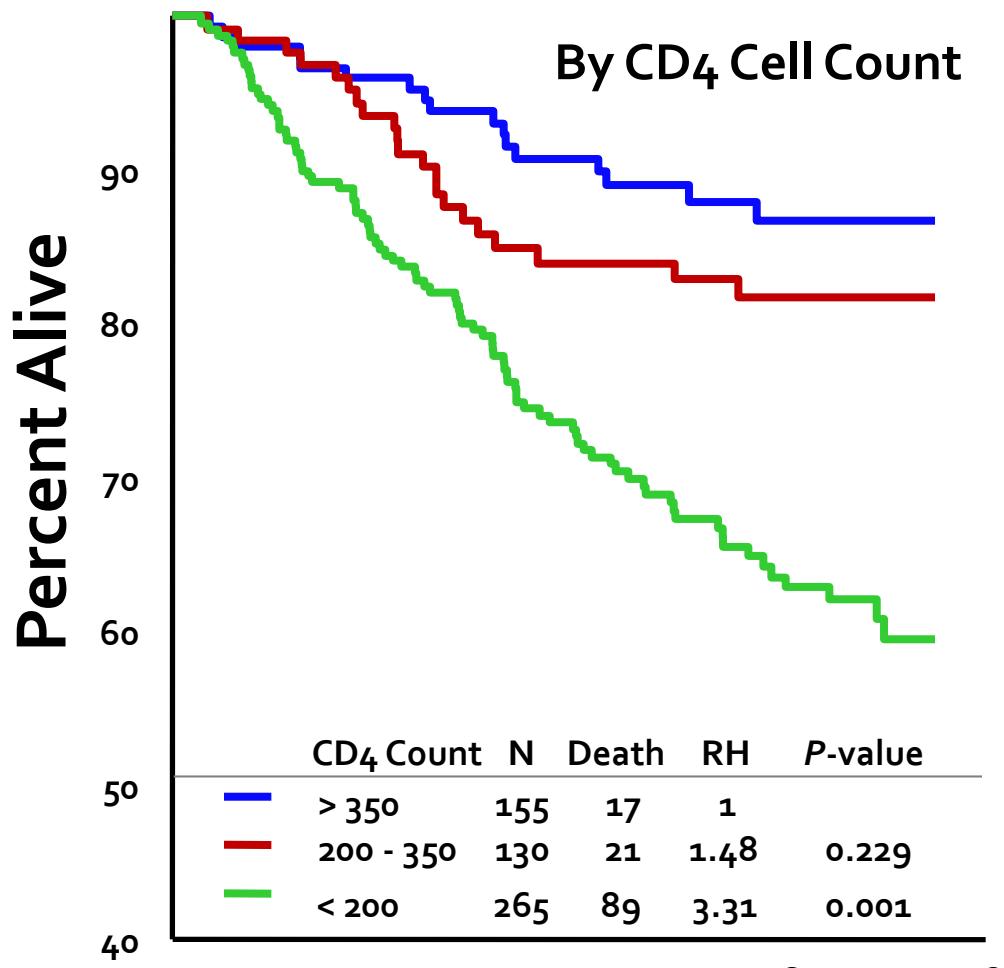

(Anastos, Barrón, . . . , Muñoz, Arch Int Med 2002; 162:1973-1980)

Death among Women with AIDS at HAART Initiation

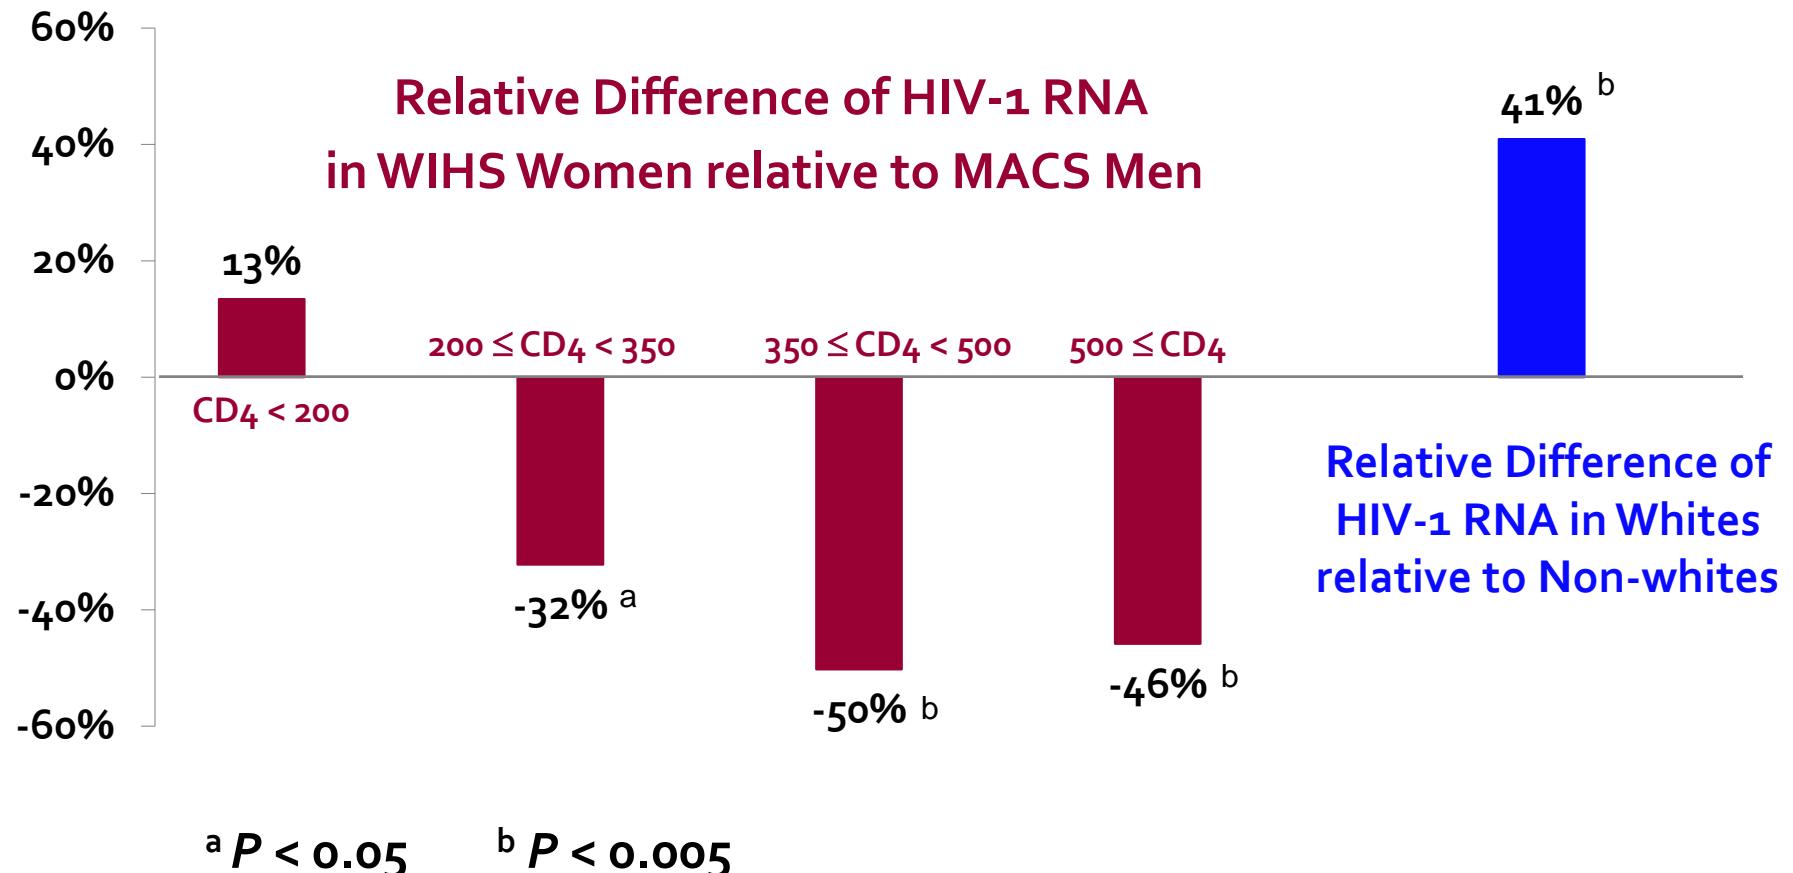

(94/95 cohort)

(Anastos, Barrón, . . . , Muñoz, *Arch Int Med* 2002; 162:1973-1980)

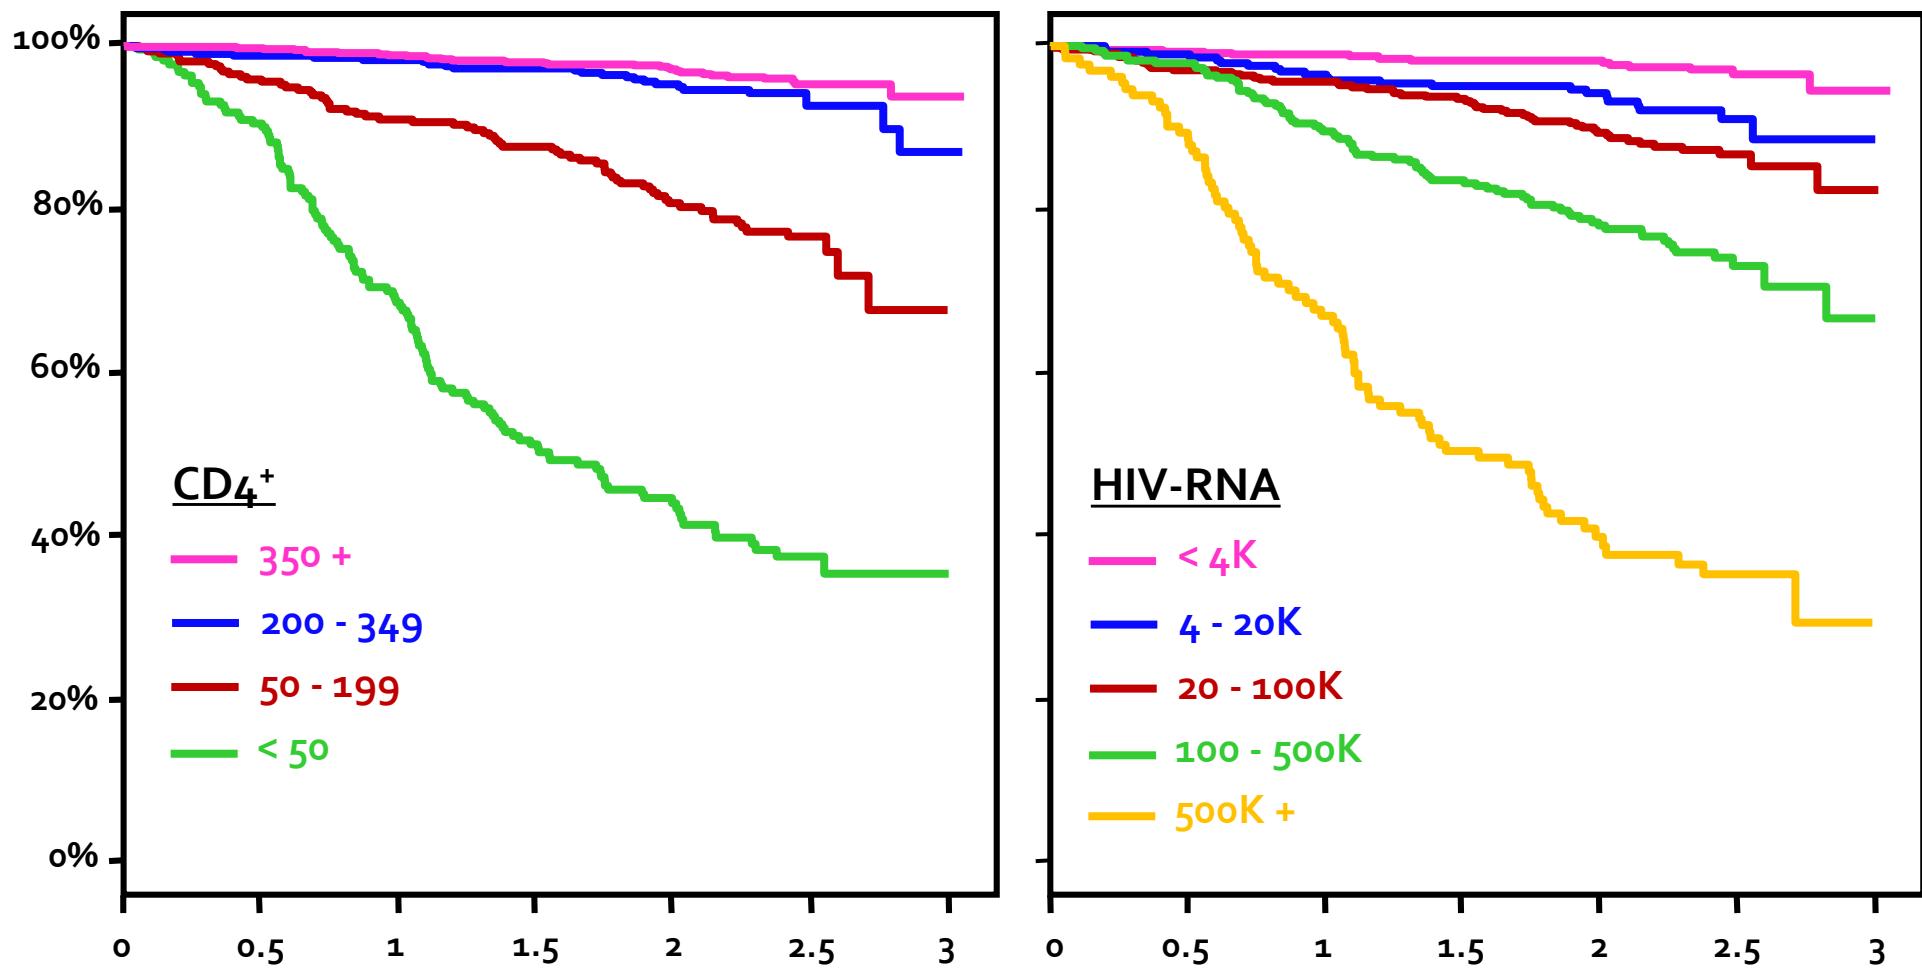

Association of Race and Gender with HIV-1 RNA

(Anastos, Gange, . . . , Greenblatt, *J Acquir Immune Defic Syndr* 2000; 24:218-226)

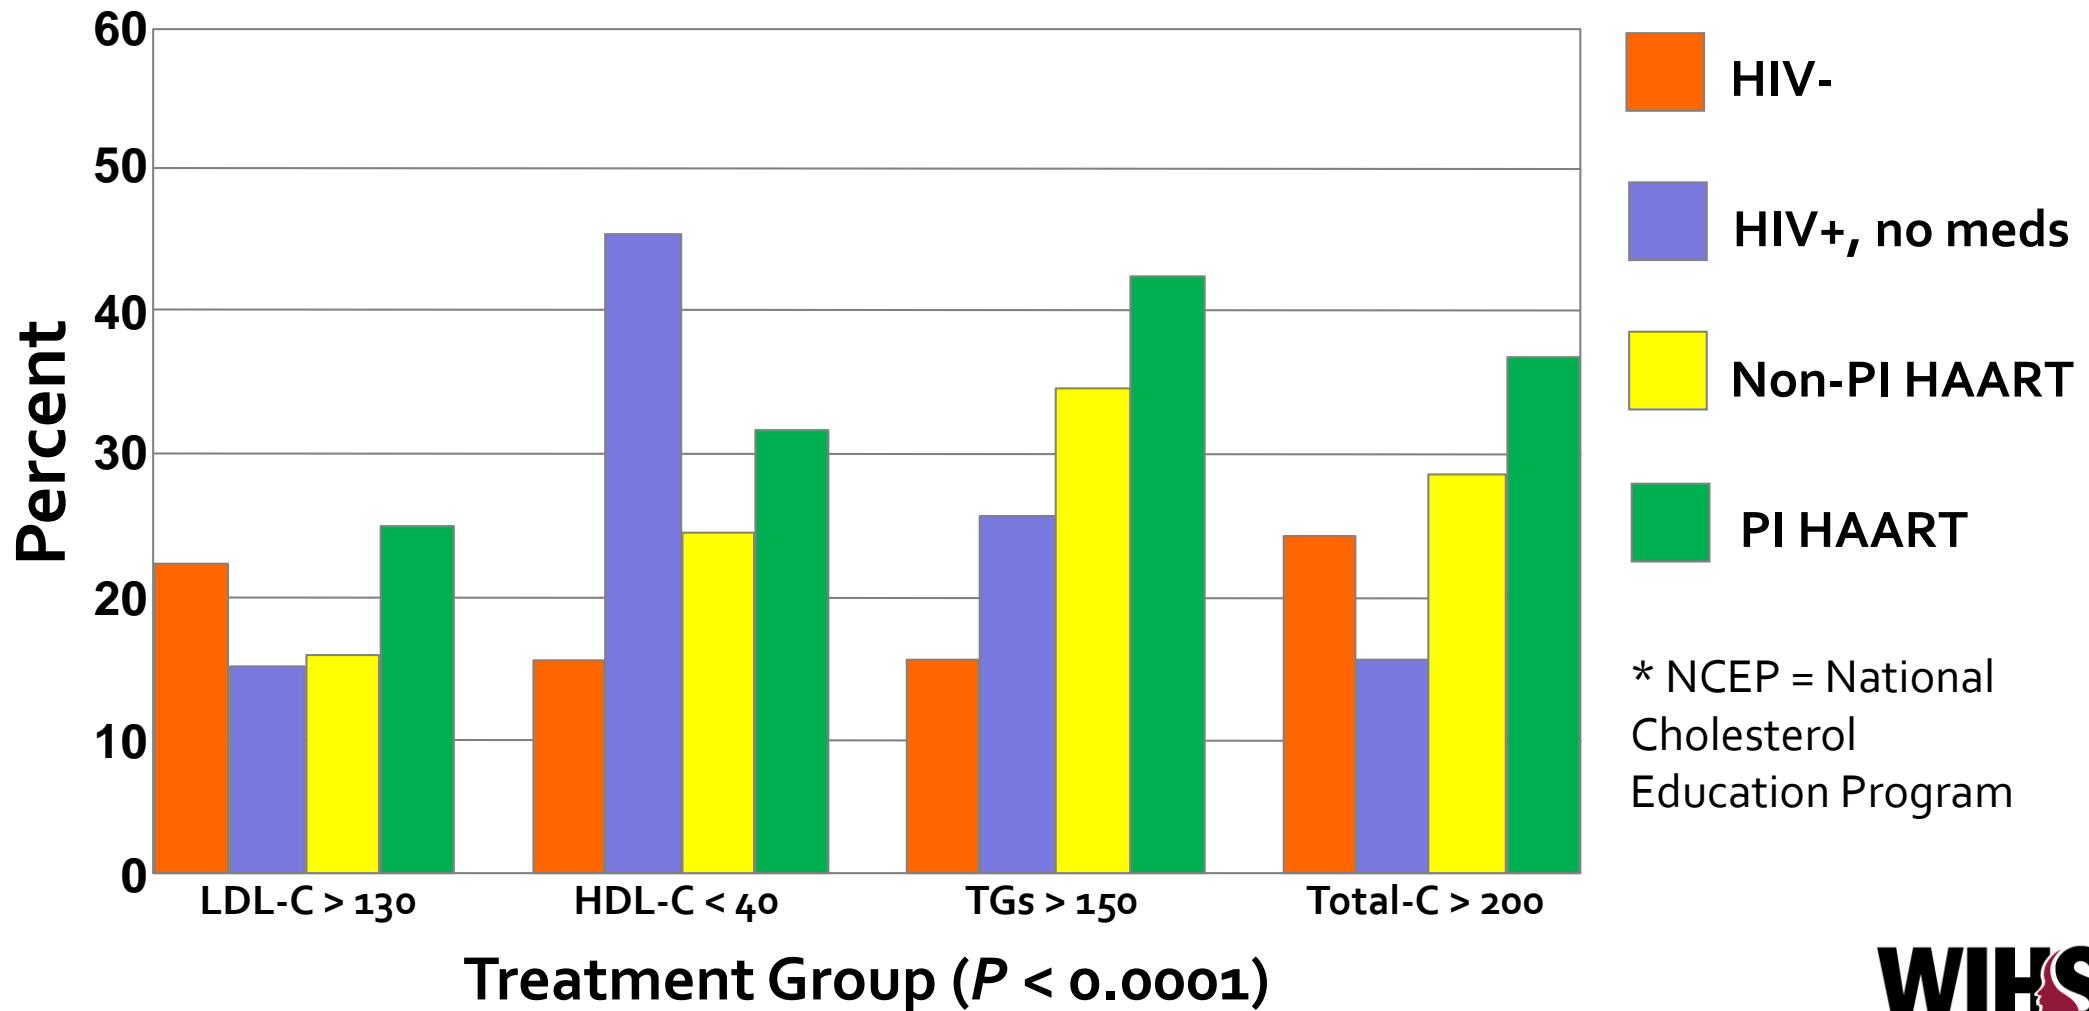

Survival Time According to CD4⁺ and HIV RNA

(Anastos, Kalish, . . . , Kovacs, AIDS 1999; 13:1717-1726)

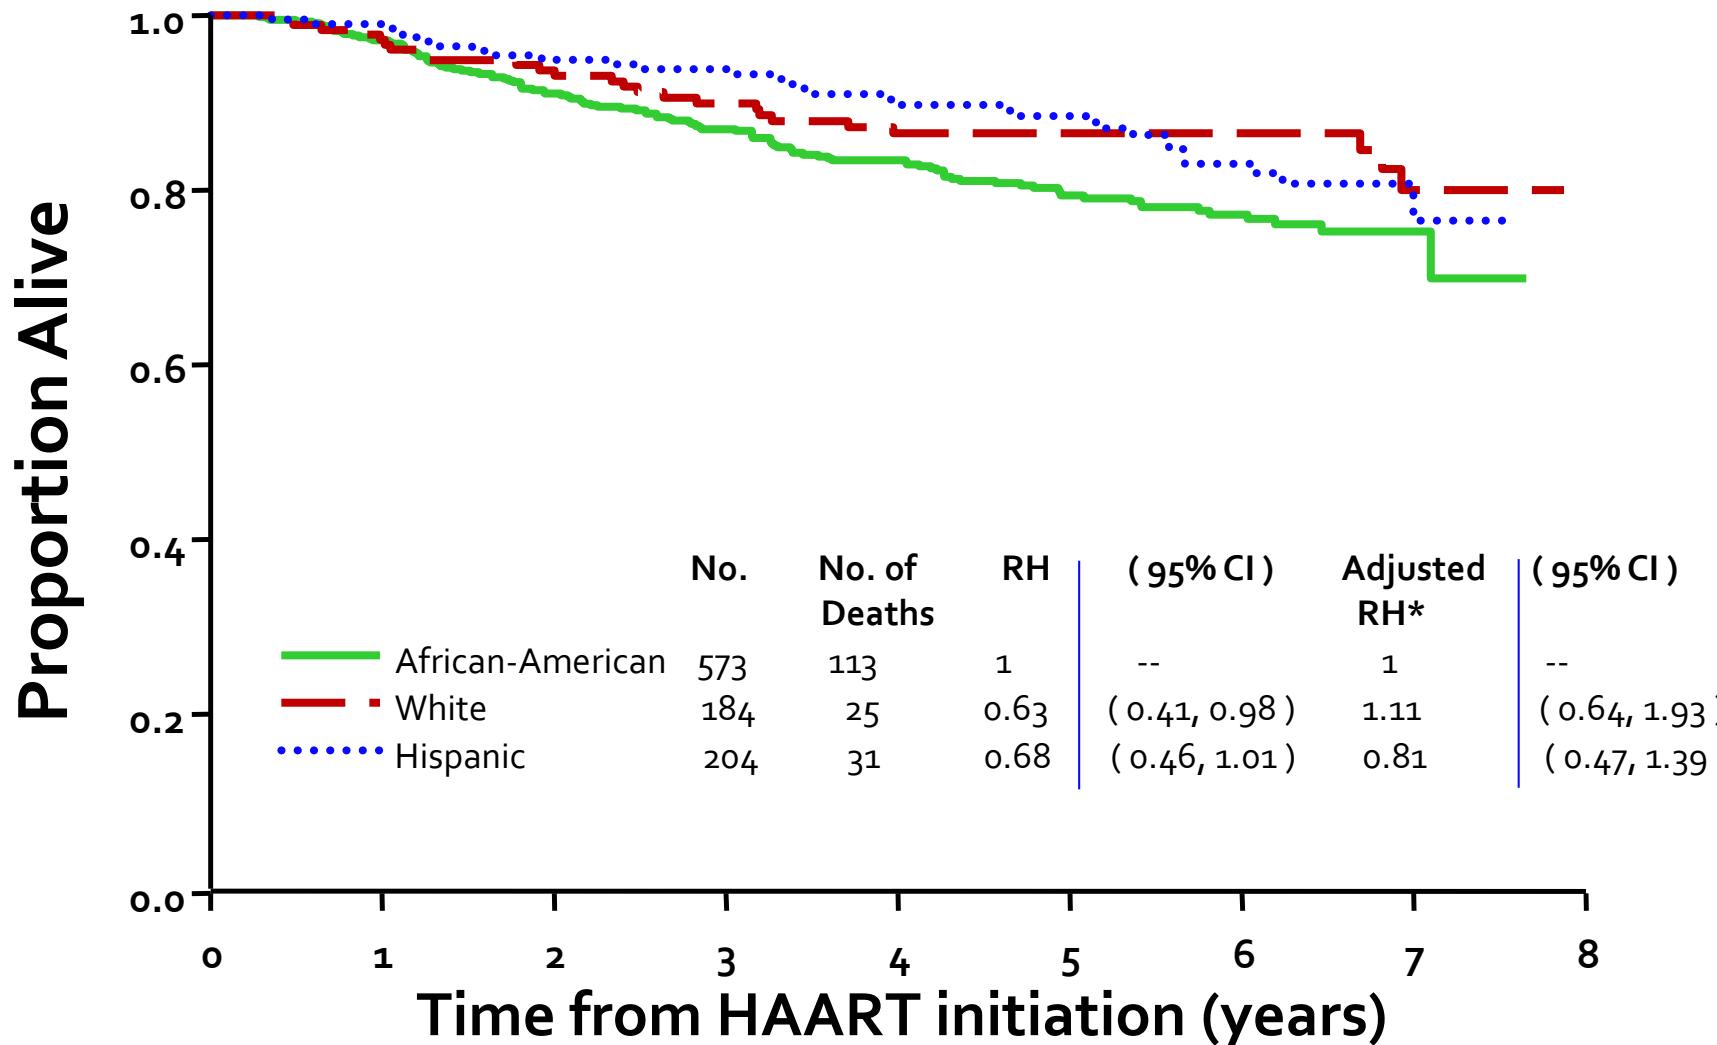

Proportion of Women Meeting NCEP Treatment Thresholds by HIV Status and ART Use*

(Anastos, Lu, . . . , Justman, *J Acquir Immune Defic Syndr* 2007; 45:34-42)

Factors Associated with Response to HAART

(Anastos, Schneider, . . . , Cohen, *J Acquir Immune Defic Syndr* 2005; 39,5:537-544)

* Adjusted for ART use prior to HAART initiation, age at last pre-HAART visit, pre-HAART AIDS status, pre-HAART nadir CD4⁺ cell count, pre-HAART peak HIV-1 RNA, self-reported baseline HIV-1 exposure category, depression, current drug use, cigarette smoking, income, ART use following HAART initiation.

Factors Associated with Response to HAART

(Anastos, Schneider, . . . , Cohen, J Acquir Immune Defic Syndr 2005; 39,5:537-544)

Exposure	Virologic Response	Virologic Rebound	Immunologic Response	Immunologic Failure	Incident ADI	Death	AIDS Death
ART naïve prior to HAART	1.77	0.82	0.96	0.72	1.29	0.94	1.41
Age at last pre-HAART visit (per 10 years)	1.19	0.91	1.12	1.00	0.98	1.36	1.18
Pre-HAART AIDS	0.98	1.04	0.93	0.92	2.19	1.35	1.62
Pre-HAART nadir CD4 ⁺ count (per 100 cells)	1.08	1.02	1.09	1.27	0.86	0.61	0.30
Pre-HAART peak HIV-1 RNA (per log ₁₀)	0.62	1.48	1.02	0.89	1.38	1.61	1.63
Therapy used after HAART							
No therapy	1	1	1	1	1	1	1
Mono/combo	8.55	0.30	4.07	0.59	0.72	0.53	0.71
HAART	16.14	0.26	7.04	0.31	0.74	0.46	0.33
Depression (CES-D > 16)	0.81	1.22	0.96	1.98	1.62	1.65	1.06
Current drug use	0.89	1.23	0.85	1.11	1.49	1.04	2.35
Currently smoke cigarettes	0.72	1.30	1.04	0.93	1.18	1.38	1.05
Income <\$12,000	0.91	1.25	0.98	1.45	1.19	1.64	1.39
Adherence	2.19	0.37	1.47	0.66	0.65	0.67	0.53

Note: Adjusted for HIV-1 exposure and race. Significant values are in red.

Risk Factors for HIV-associated Sensory Neuropathy

(Anziska, Helzner, . . . , Burian, *J Neuro Sci* 2012;315(1-2):129-132)

Multivariable analysis		
	Odds ratio (95% CI)	P-value
Age ^a	1.30 (1.20-1.40)	<0.001
Diabetes	1.45 (1.02-2.08)	0.04
Alcohol use	0.82 (0.49-1.4)	0.48
Hepatitis C	1.45 (1.03-2.05)	0.03
CD4 count ^b	1.0 (1.0-1.0)	0.96
Viral load ^c	0.97 (0.83-1.1)	0.62
D-NRTI	1.19 (0.65-2.17)	0.57
African Americans	1.67 (1.22-2.27)	0.001

^aper 5 years.

^clog₁₀ copies/mL

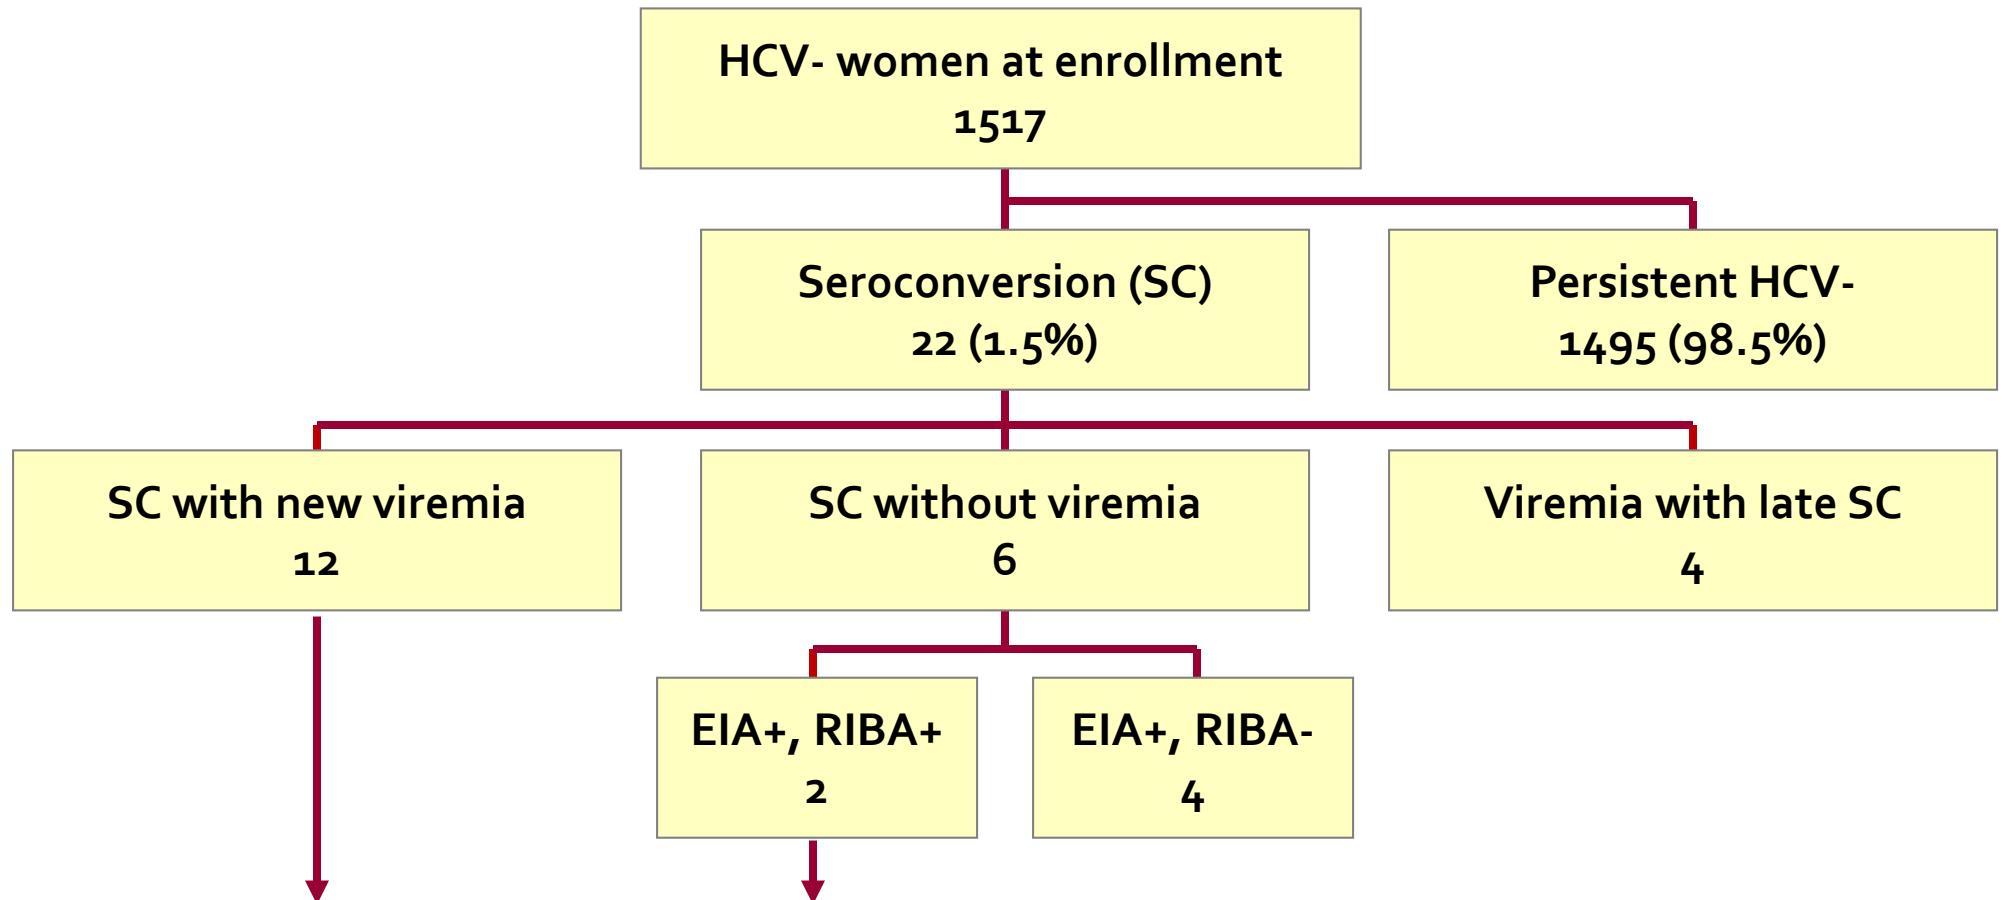

Hepatitis C Virus Infection and Biological False-positive Syphilis Tests

(Augenbraun, French, . . . , Sharma, *Sex Transm Infect* 2010; 86:97-98)

- ▶ Non-treponemal serological tests (e.g., RPR) are frequently reactive in individuals with HCV infection
- ▶ In patients with evidence of HCV infection, reactive non-treponemal serological tests are often not confirmed by reactive treponemal-specific tests and therefore should be considered less specific for detecting true disease
- ▶ Discordant treponemal serological tests in HCV-infected individuals appear to occur independently of a history of IDU or HIV infection

Hepatitis C Virus (HCV) Antibody Acquisition in the WIHS

(Augenbraun, Goedert, . . . , Terrault, *Clin Infect Dis* 2003; 37:1357-1364)

Number with true HCV acquisition = 14

Comparison of Baseline HIV Disease by Herpes Simplex Virus-2 Infection Status

(Aumakhan, Gaydos, . . . , Gange, *PLoS ONE* 2010; 5:e9973)

Characteristic	Asymptomatic (n=262)	Symptomatic (n=388)				P ^a
	SR GH (n=101)	1 L-V (n=125)	2 L-V (n=92)	3 L-V (n=70)		
# (%) w/ HIV VL \leq 4000 cp/ml	107 (41%)	36 (36%)	34 (27%)	22 (25%)	9 (13%)	<0.001
Median HIV VL ^b	25,000	42,000	46,000	76,500	92,000	<0.001
Median CD4+	418	391	347	282	138	<0.001

^a P-value for overall comparison of symptomatic group vs. asymptomatic group.

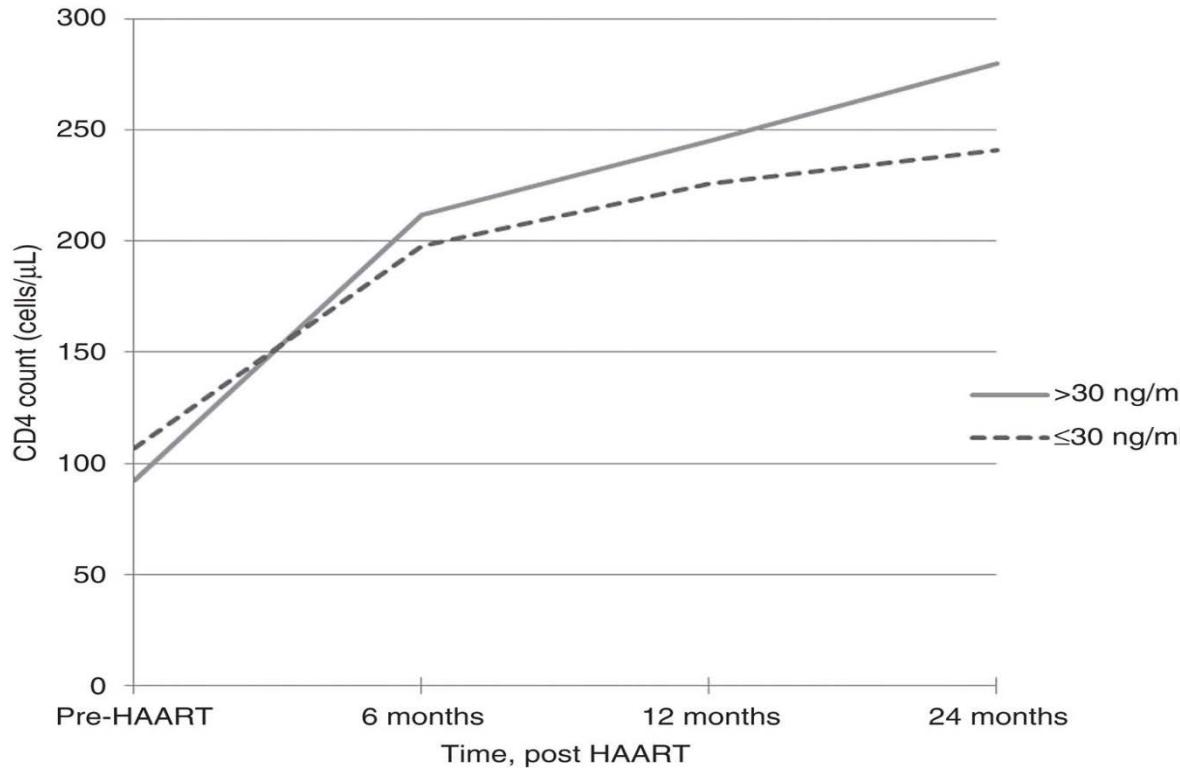

^b Among women with HIV VL >4,000 copies/ml.

SR GH: self-reported genital herpes; L-V: lesion-visit.

Vitamin D Insufficiency May Impair CD4 Recovery among Women with Advanced Disease on HAART

(Aziz, Livak, . . . , Adeyemi, AIDS 2013;27(4):573-578)

Mean CD4 count (cells/µL) among women with normal (>30 ng/ml) and insufficient or deficient vitamin D (≤ 30 ng/ml), before HAART initiation and 6, 12, and 24 months post-HAART initiation.

In univariate analysis of variance (ANOVA), difference in mean CD4 by vitamin D status is non significant ($F = 0.639, P = 0.424$); difference in mean CD4 by time point is significant (ANOVA $F = 14.92, P < 0.001$); and vitamin D by time interaction is nonsignificant ($F = 0.358, P = 0.783$).

Multivariate Models of HCV Infection Risk

(Bacchetti, Tien, . . . , Edlin, *BMC Infect Dis*, 2007; 7:145)

	WIHS			SFUHS*		
	OR	(95% CI)	P	OR	(95% CI)	P

Multivariate random intercept logistic regression model of NVP concentration in hair as a predictor of virologic success (n = 714 observations from n = 181 women)

High Oral HPV16 Viral Load Predicts Long-term Persistence

(Beachler, Guo, . . . , D'Souza, *J Infect Dis* 2015;212(10):1588-1591)

Time to clearance of oral HPV16 infections among 88 oral HPV16 infected individuals, by HPV16 viral load tertile at first visit infection detected*^

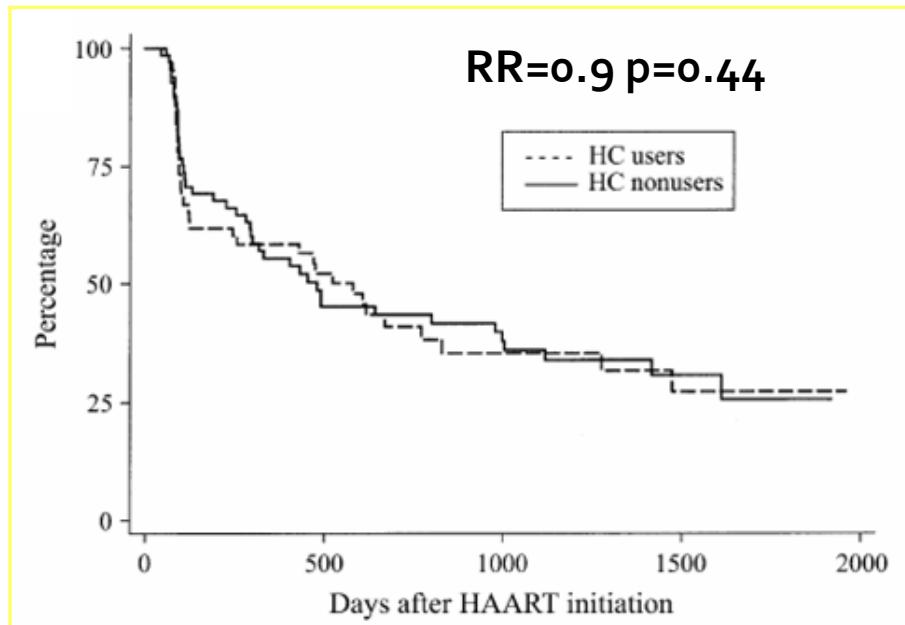

*Oral HPV clearance defined at first visit when oral HPV16 DNA was not detected.

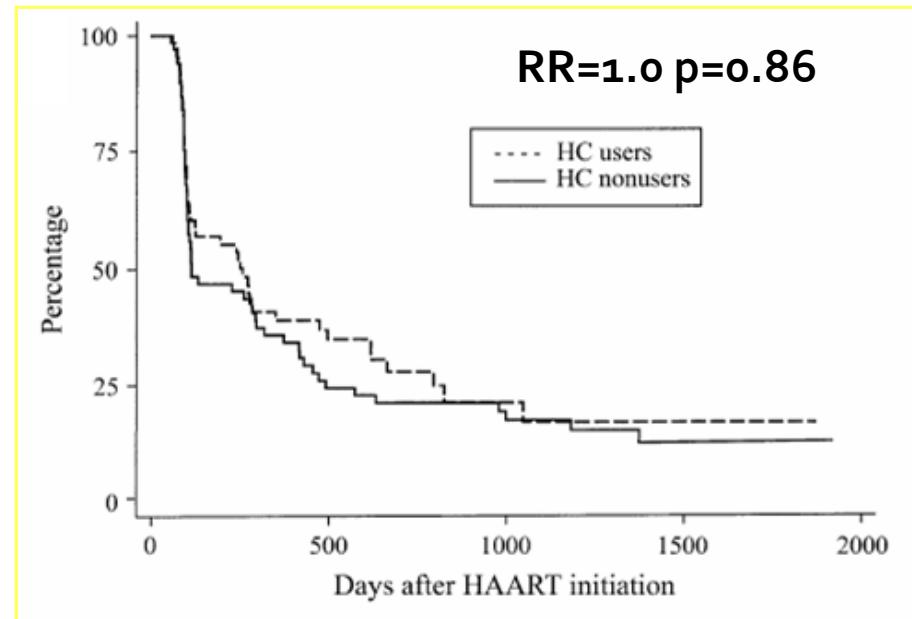

^Tertile ranges: Lowest Tertile 0.0-5.9 copies per 100,000 cells; Middle Tertile: 6.0-155.3 copies per 100,000 cells; Highest Tertile: >155.3 copies per 100,000 cells. The p-trend was calculated using the log-rank test.

Use of Hormonal Contraceptives (HC) Does Not Impact the Effectiveness of HAART

(Chu, Gange, . . . , Greenblatt, *Am J Epidemiol* 2005;161:881-890)

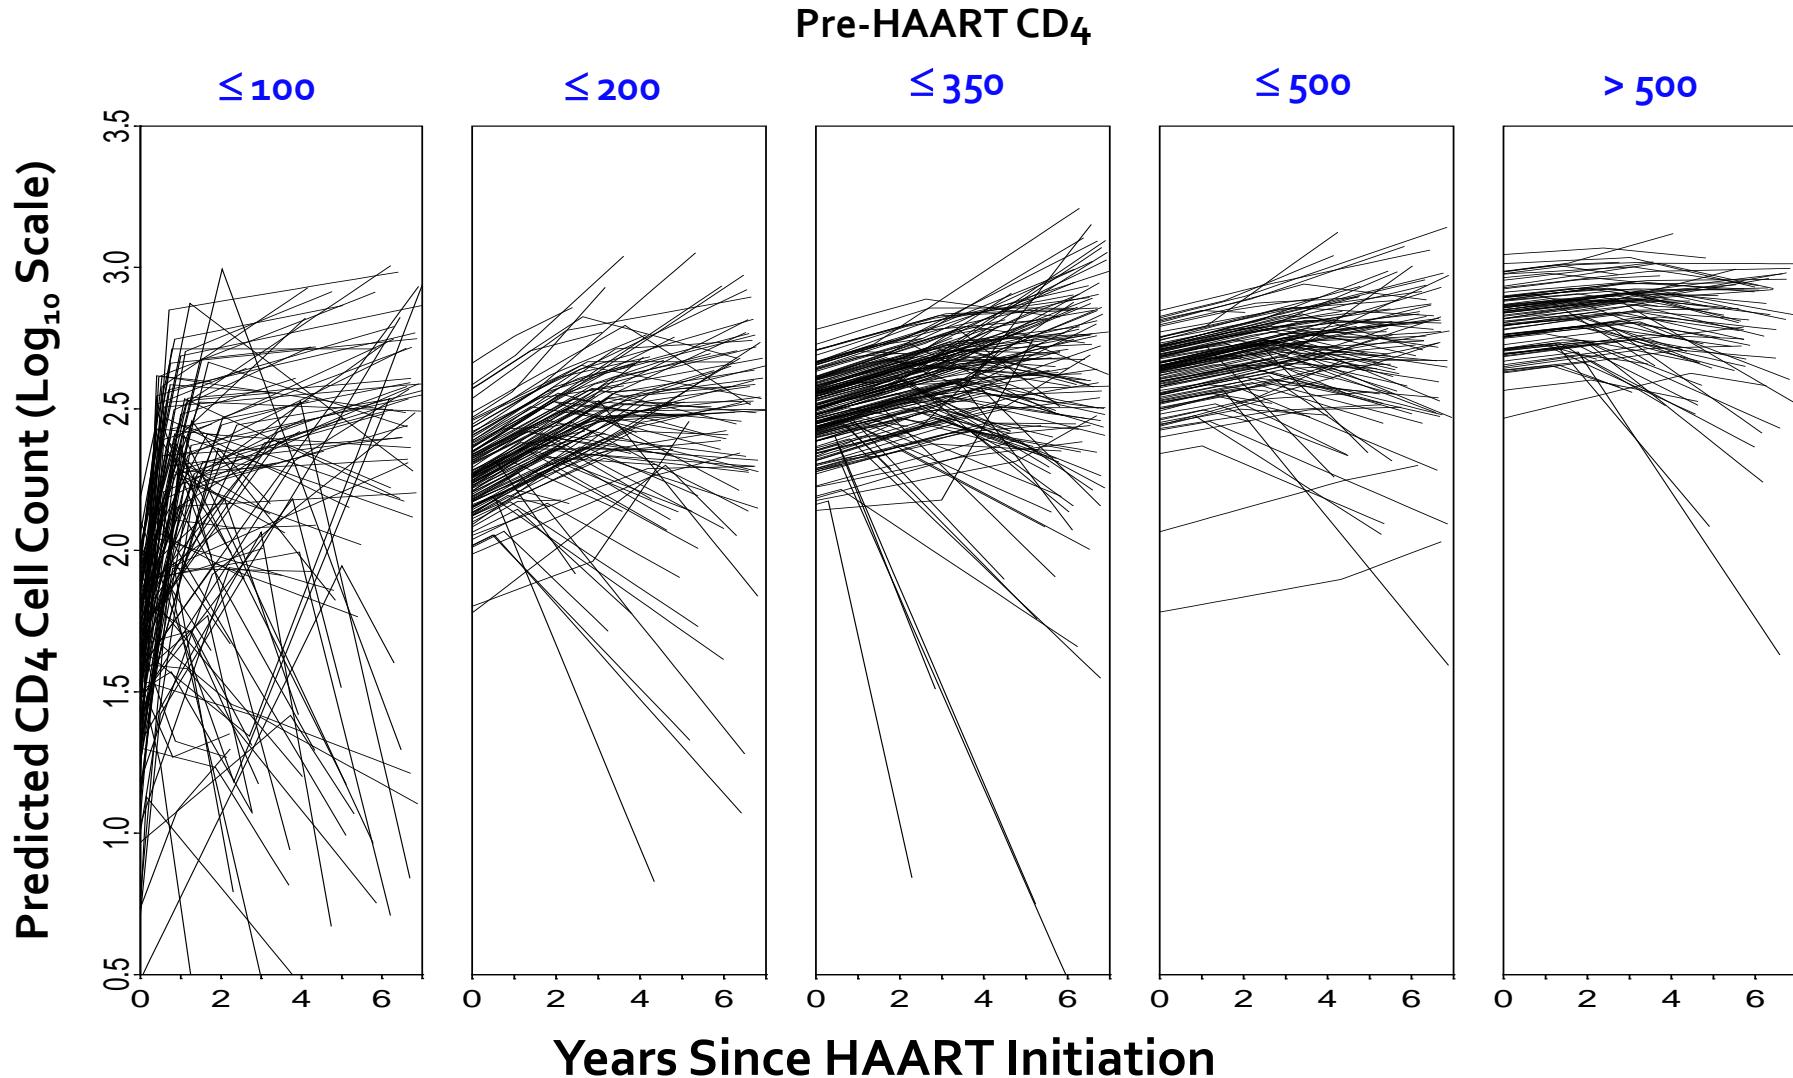

Percentage of Subjects Achieving
CD4+ Cell Count Increase of 50 cells/mm³

Percentage of Subjects Achieving
HIV RNA < 80 copies/ml

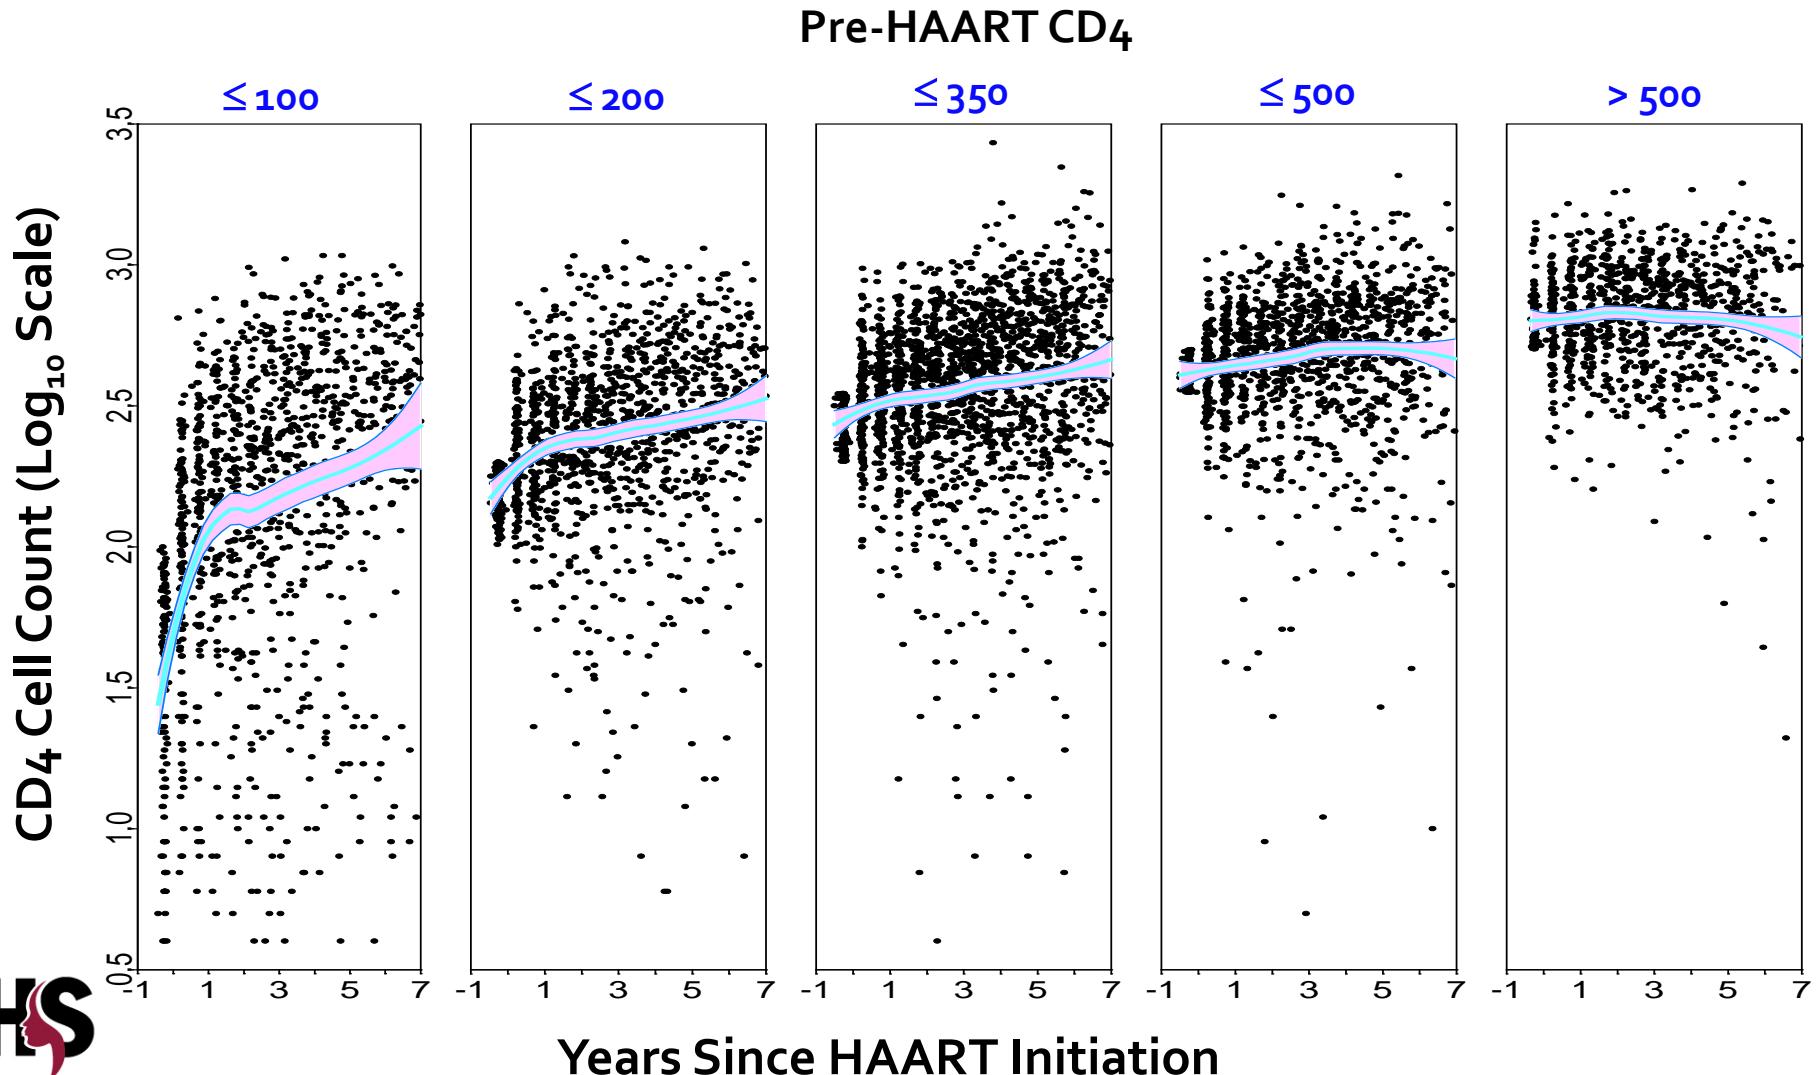

Individual Variation of CD4 T-Cell Trajectory among HIV+ on Long-term HAART (1)

(Chu, Gange, . . . , Jacobson, Am J Epidemiol 2005; 162, 8:787-797)

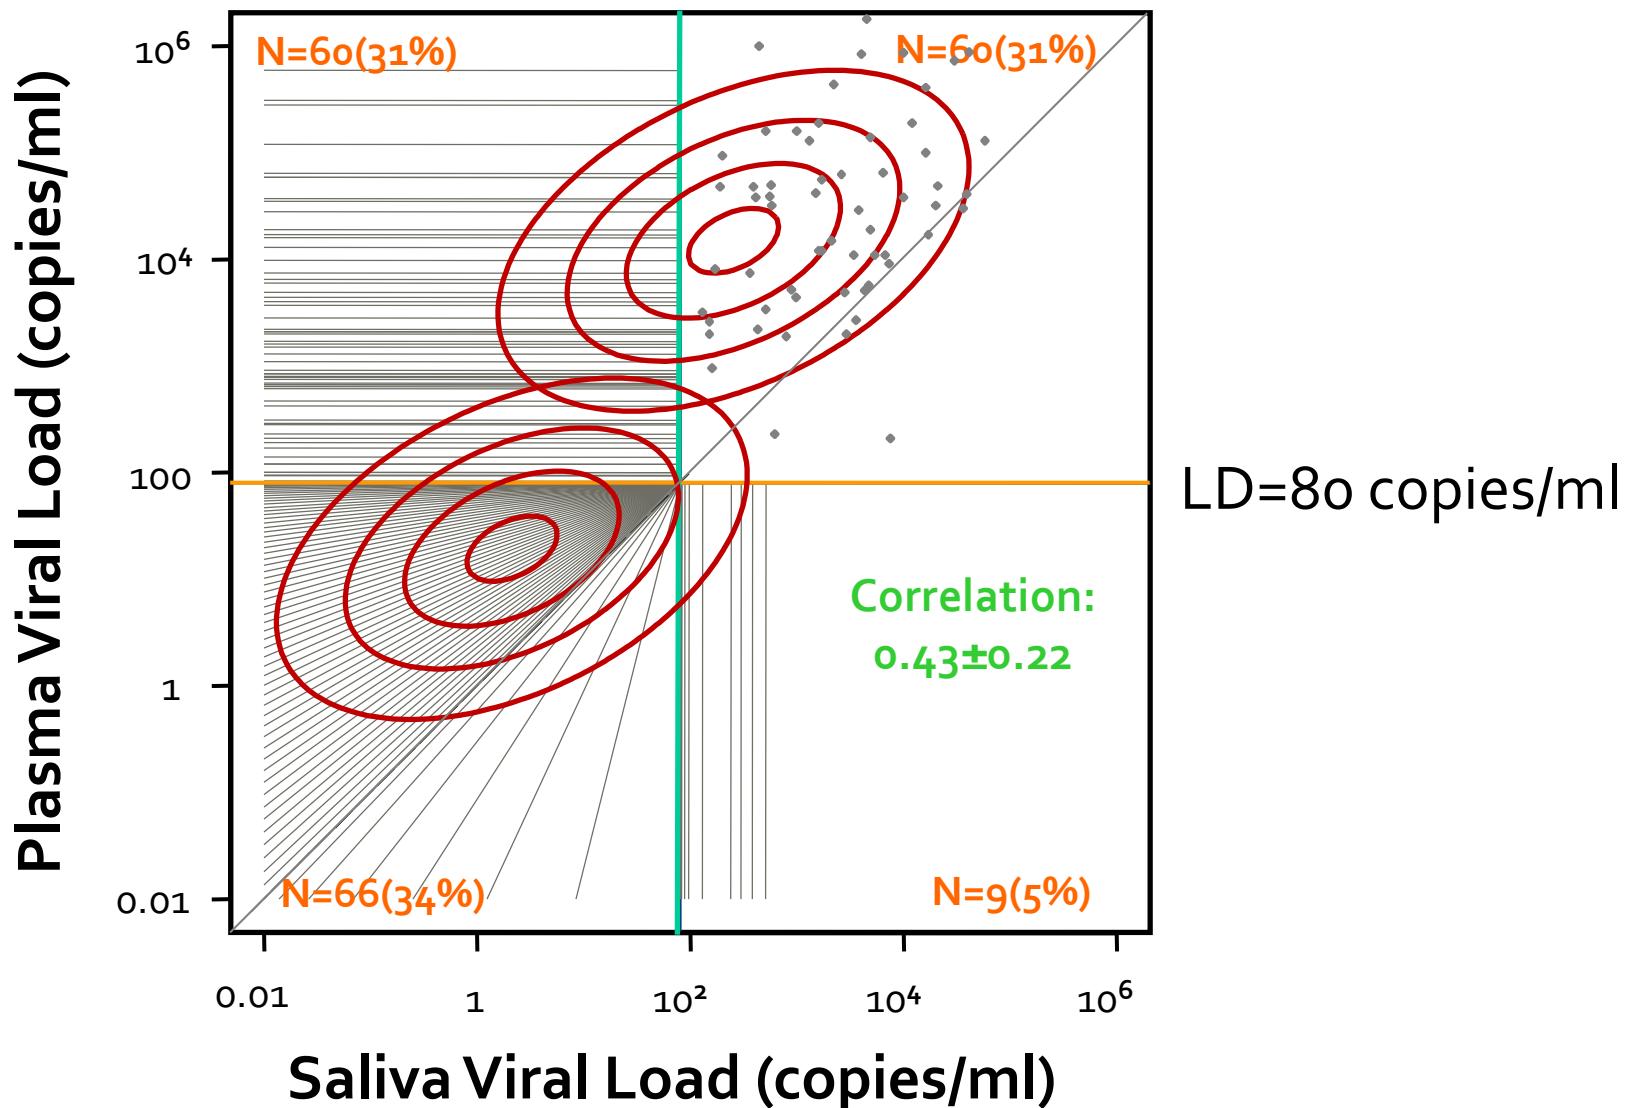

Individual Variation of CD4 T-Cell Trajectory among HIV+ on Long-term HAART (2)

(Chu, Gange, . . . , Jacobson, *Am J Epidemiol* 2005; 162, 8:787-797)

Correlation of Plasma and Saliva Viral Loads

(Chu, Moulton, . . . , Muñoz, *Applied Statistics* 2005; 54,5:831-845)

Characteristics Associated with Receipt of a Contraindicated Initial ARV Regimen

(Cocohoba, Wang, . . . Greenblatt, *J Acquir Immune Defic Syndr* 2008; 47:377-383)

Effect	OR (95% CI)
Age per 10 years	1.10 (0.66 – 1.84)
CD4 cell count nadir per 100 cells	1.07 (0.86 – 1.34)
Pre-initiation HIV VL (per \log_{10} copies)	0.43 (0.26 – 0.71)
Race	
Non-Hispanic black vs. other	1.06 (0.32 – 3.48)
Hispanic vs. other	0.88 (0.20 – 3.90)
Initial ARV regimen before 2001	4.17 (1.61 – 11.1)

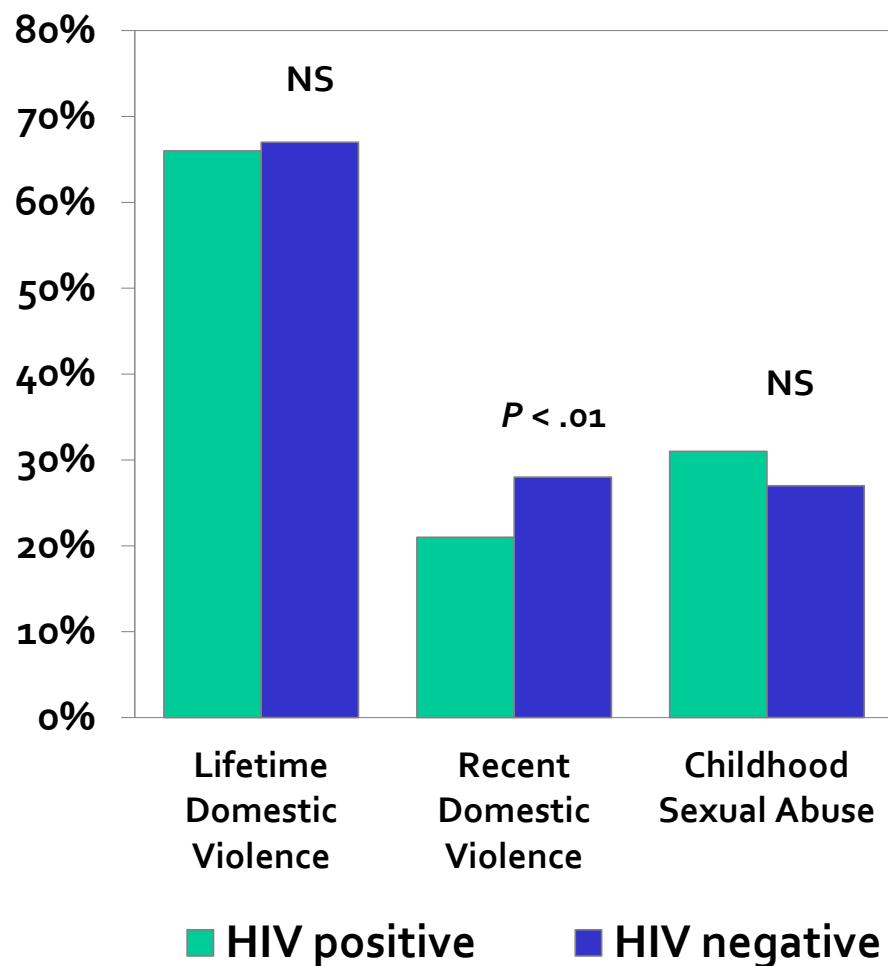

NOTE: Adjusted for WIHS study site.

Domestic Violence and Childhood Sexual Abuse in WIHS Women

(Cohen, Deamant, . . . , Melnick, *Am J Public Health* 2000; 90:560-565)

Baseline Prevalence

Multivariate Behavioral Correlates of Childhood Sexual Abuse

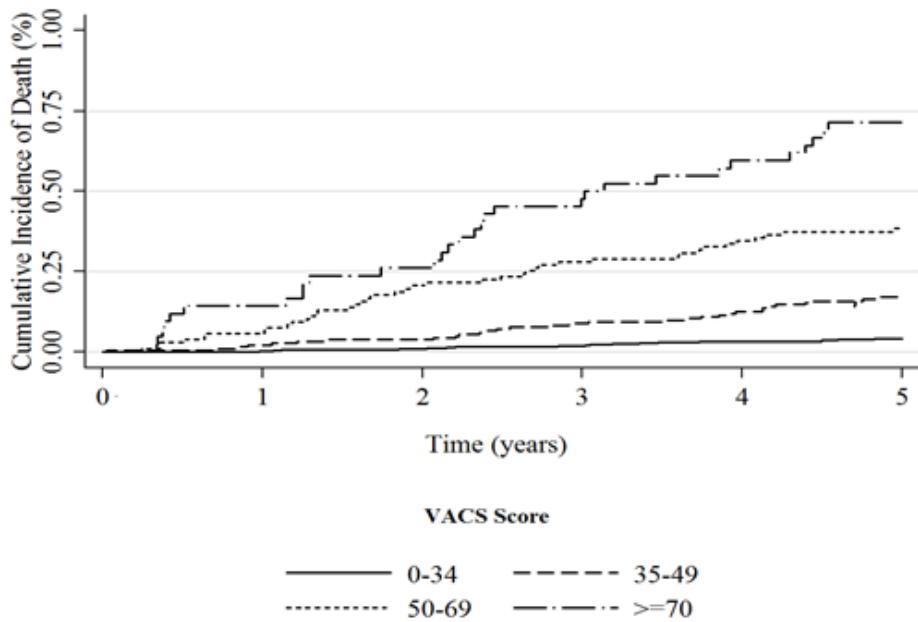

- Drug use, ever
(OR* = 4.25, $P < .001$)
- Male partner w/HIV risk
(OR* = 2.07, $P < .001$)
- Lifetime male sex partners (>10)
(OR* = 2.29, $P < .001$)
- Sex for drugs, money or shelter
(OR* = 2.62, $P < .001$)

*OR adjusted for HIV serostatus, age, race/ethnicity and annual household income.

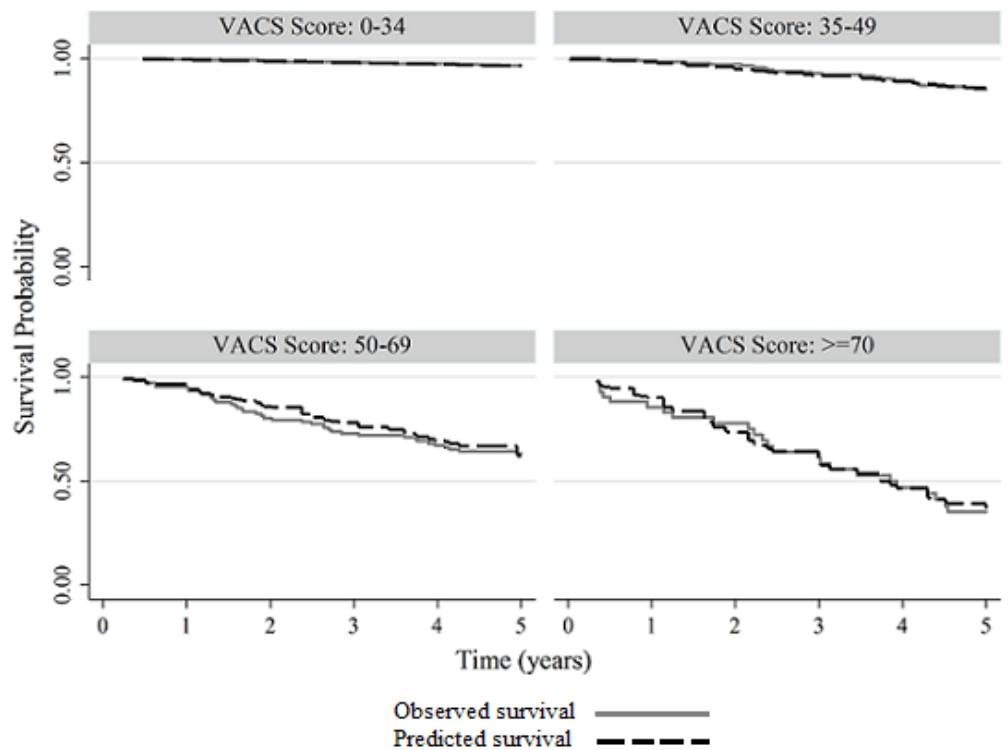

Gender-related Risk Factors Improve Mortality Predictive Ability of VACS Index among HIV-infected Women

(Cohen, Hotton, . . . , Weber, *J Acquir Immune Defic Syndr* 2015; 70(5):538-544)

5-Year Cumulative Mortality after 1 year
on HAART by Category of VACS Score:
1997–2007

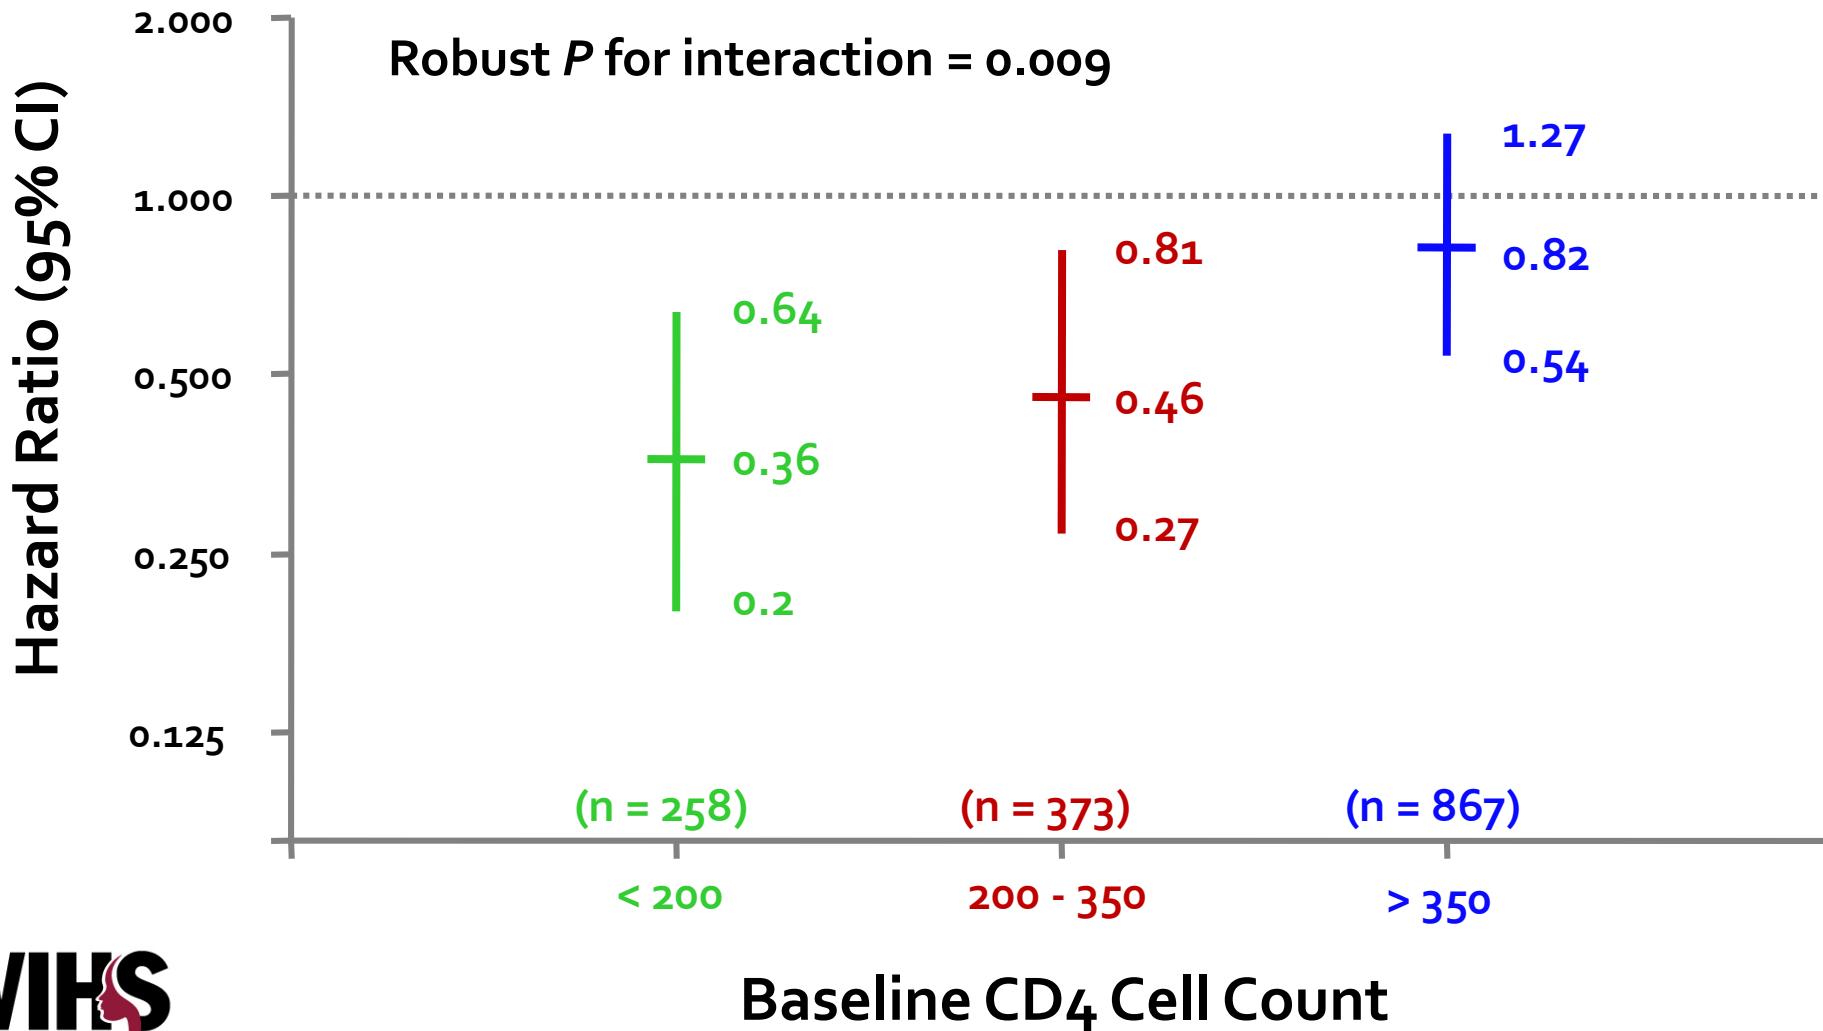

Observed vs. Expected 5-Year Survival Probability by VACS Index Score

Individual Effect of HAART on AIDS or Death

(Cole, Hernán, . . . , Muñoz, *Am J Epidemiol* 2003; 158:687-694)

Effect of HAART on Incident AIDS or Death among 950 HIV+ Men and Women

(Cole, Jacobson, . . . , Anastos, *Am J Epidemiol* 2010; 171:113-122)

Model	Exposure	Hazard Ratio	95% CL ^a
Unadjusted	No ART	1	
	HAART ^b	0.75	0.49, 1.17
Adjusted ^c		0.95	0.58, 1.56
Weighted ^c		0.36	0.21, 0.61
Weighted & calibrated		0.17	0.06, 0.43 ^d

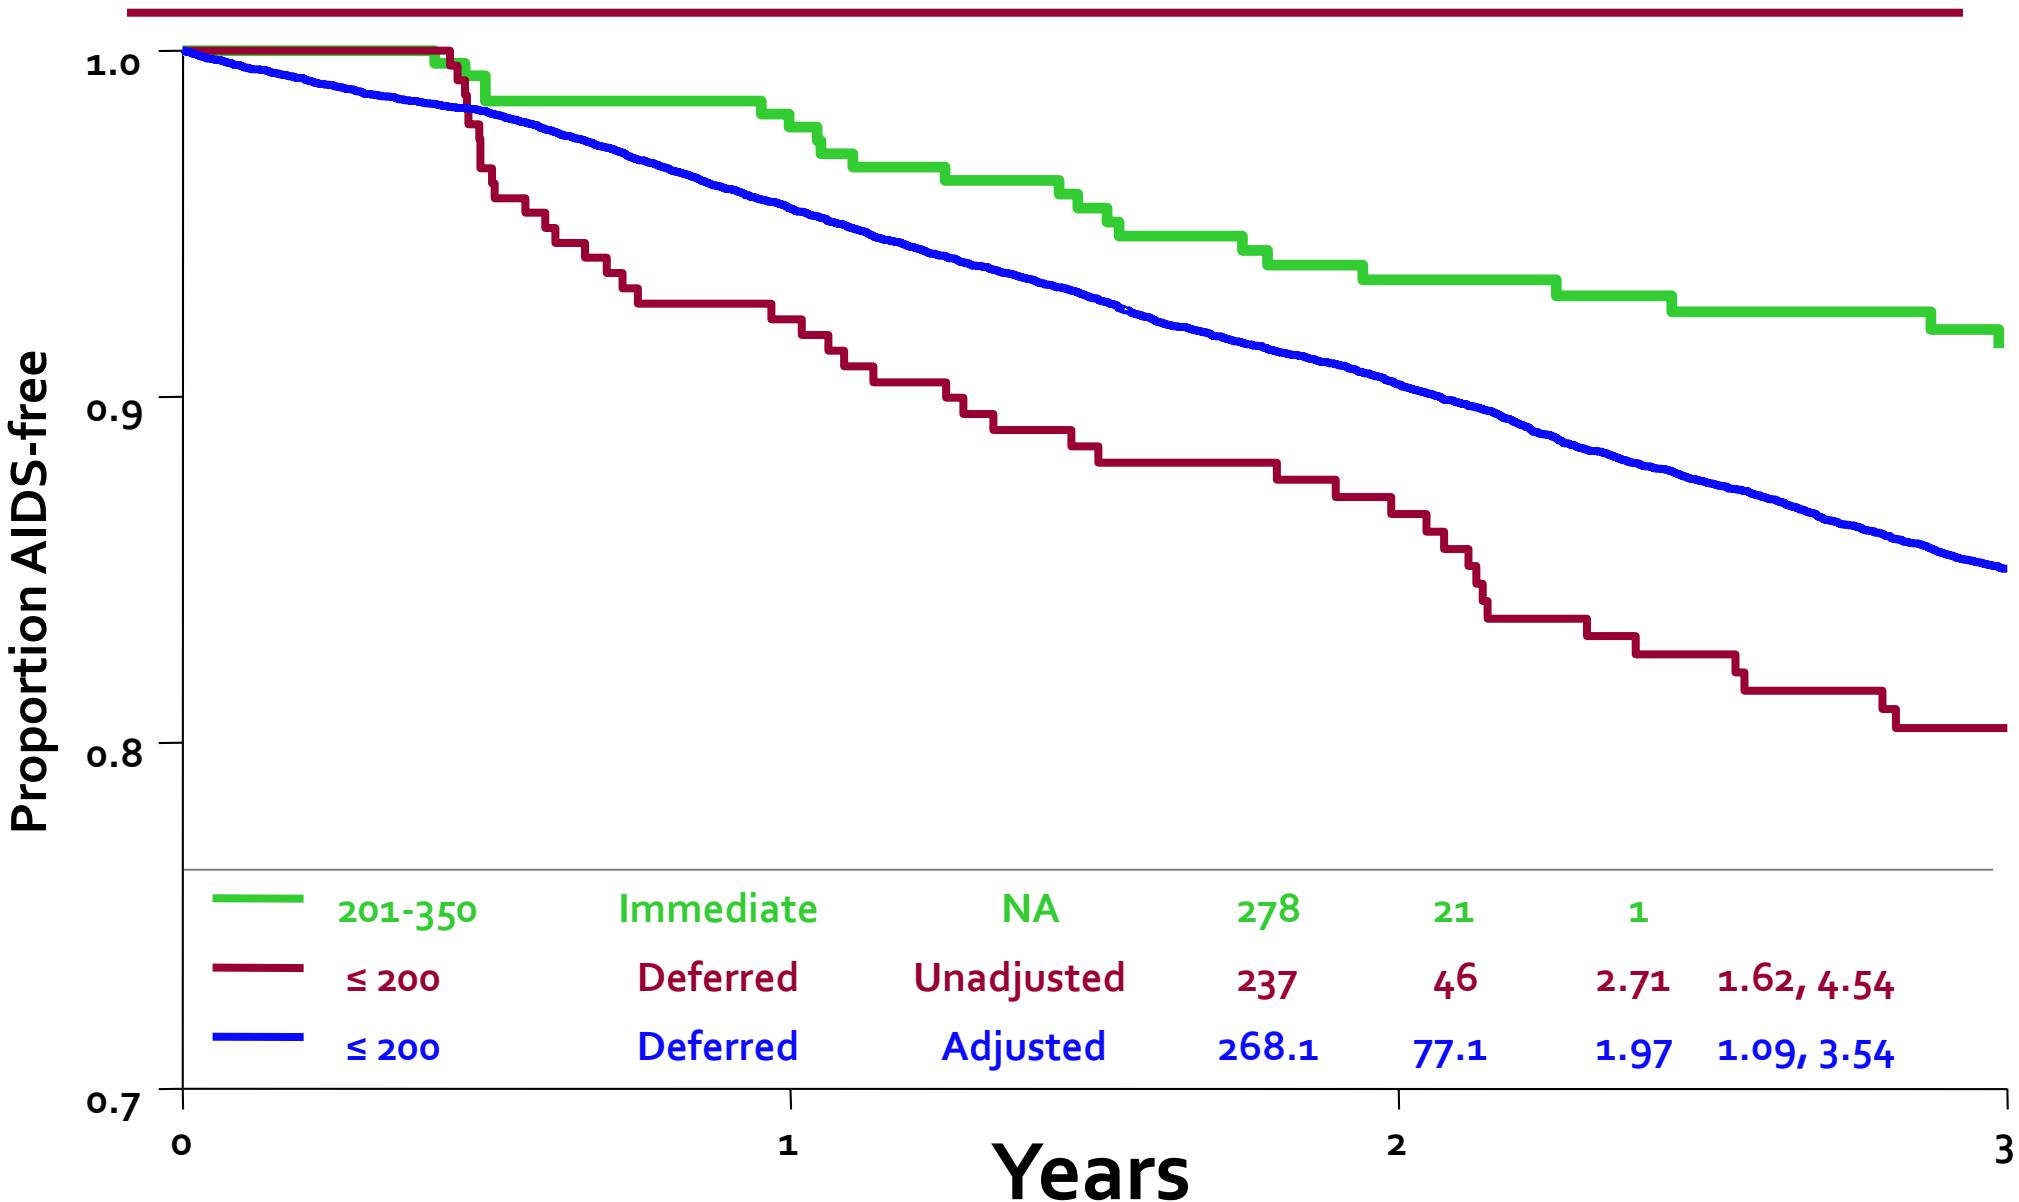

^a Robust for weighted models.

^b Use during the prior 2 years.

^c Controlled for time-varying prior CD4 cell count and HIV RNA level by using restricted cubic splines.

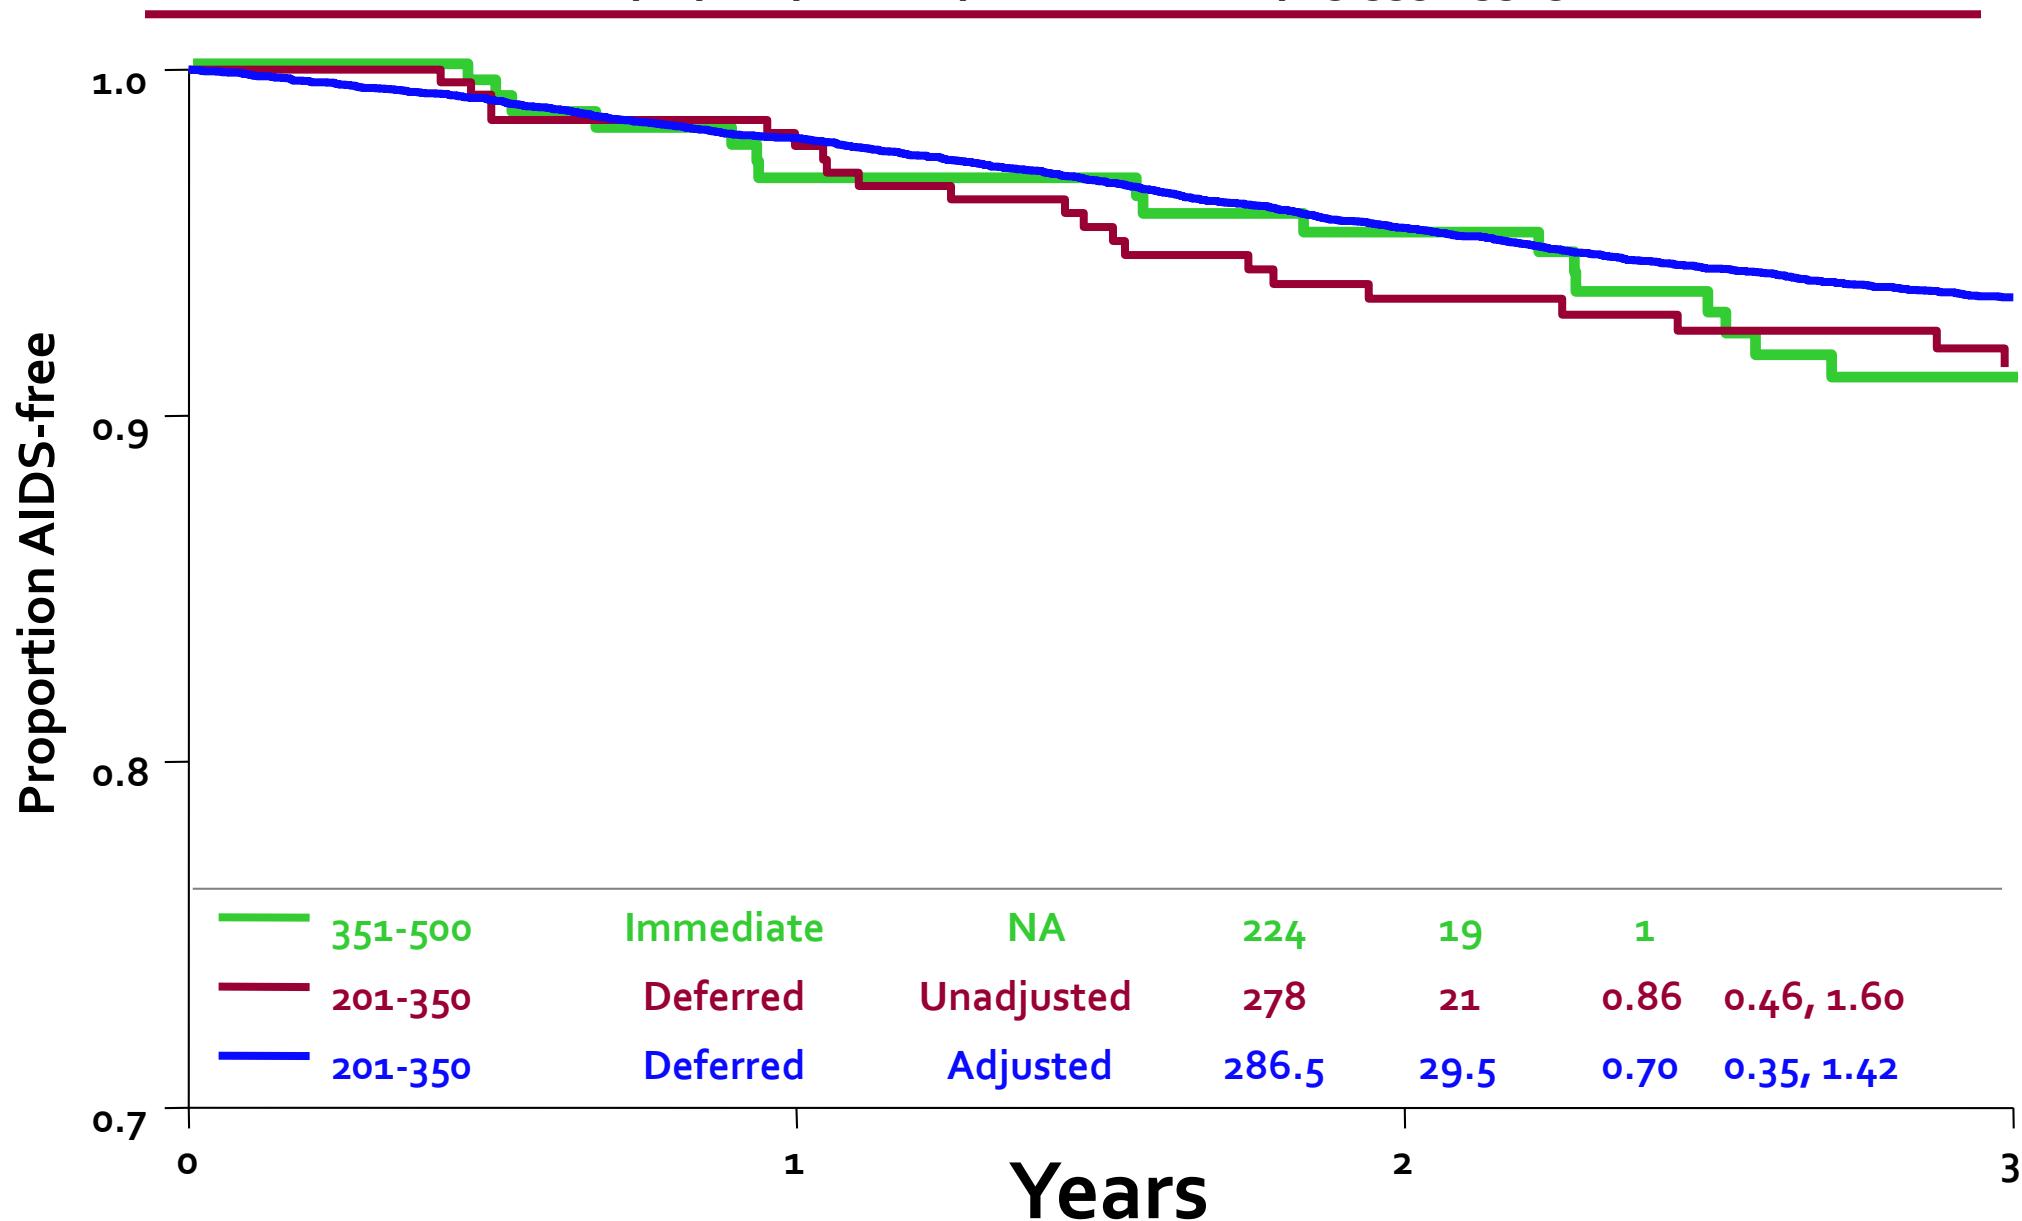

^d Confidence limits obtained by the delta method using robust variance.

Percent AIDS-free after HAART Initiation (MACS & WIHS) (1)
(Cole, Li, . . . , Muñoz, *Stat Med* 2004; 23:3351-3363)

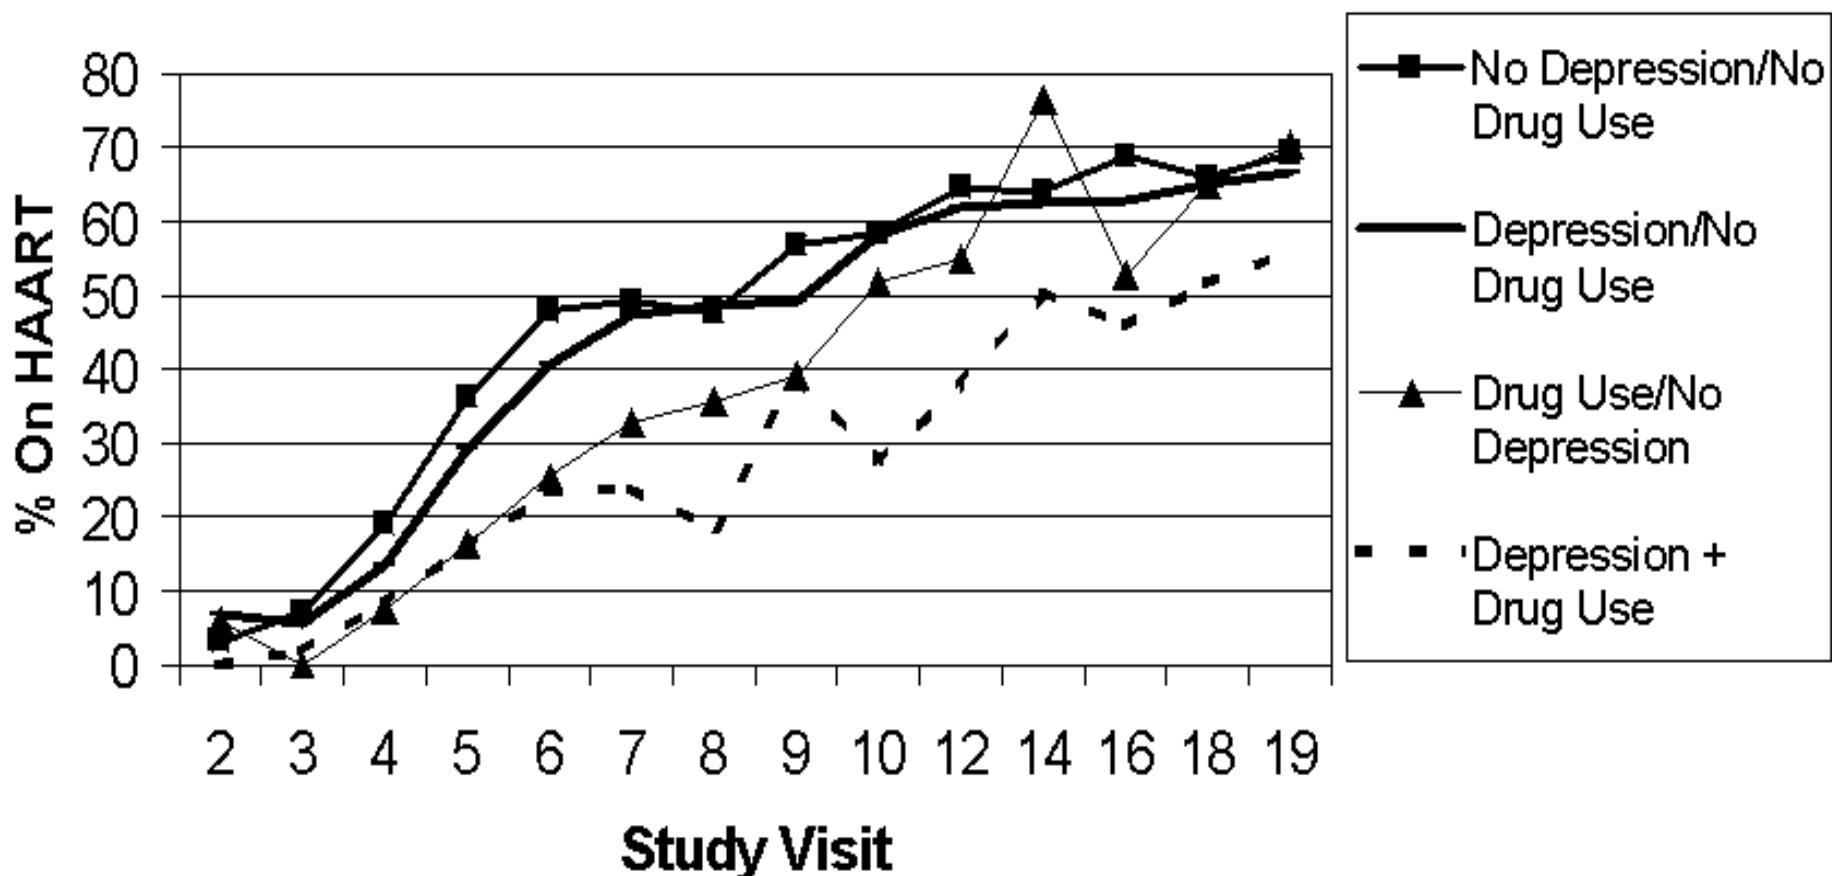

Percent AIDS-free after HAART Initiation (MACS & WIHS) (2)

(Cole, Li, . . . , Muñoz, *Stat Med* 2004; 23:3351-3363)

Proportion on HAART by Illicit Drug Use and Probable Depression

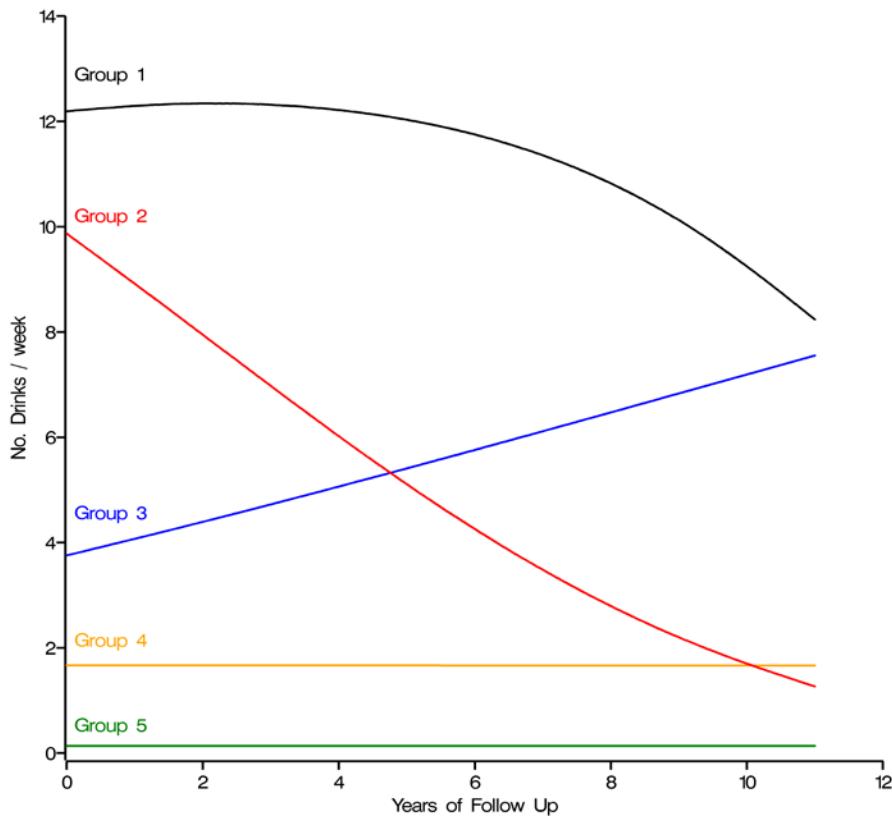

(Cook, Grey, . . . , Levine, *Drug Alcohol Dependence* 2007; 89:74-81)

Probable depression = CES-D score ≥ 16 ; Drug use = crack, cocaine, heroin use in past 6 months.

Alcohol Consumption Trajectories in Adult Women with HIV Infection: 1994-2006

(Cook, Zhu, . . . , Cohen, *AIDS Behav* 2013;17(5):1705-1712)

Drinking trajectory patterns for 3768 women. The five groups include:

- (1) Women who were persistent heavy drinkers (3%)
- (2) Women who cut back from heavy drinking to non-heavy drinking (4%)
- (3) Women who increased to heavy drinking over time (8%)
- (4) Women who remained non-heavy drinkers during the entire follow-up (36%)
- (5) Women who were non-drinkers (49%)

Alcohol Consumption Trajectories in Adult Women with HIV Infection

(Cook, Zhu, . . . , Cohen, *AIDS Behav* 2013;17(5):1705-1712)

In women with heavy drinking at baseline, factors associated with a persistent heavy drinking trajectory, compared to women who reduced drinking over time: multivariable analysis

Baseline Variable	HIV-positive (N = 329)				HIV-uninfected (N = 148)			
	Odds ratio	95 % CI	Wald χ^2	p	Odds ratio	95 % CI	Wald χ^2	p
Depression								
Yes (vs. no)	1.6	1.0-2.8	3.5	0.06				
Crack/cocaine use								
Yes (vs. no)	3.6	2.1-6.8	23.7	<0.001	5.8	2.6-12.9	18.3	<0.001
HCV seropositive								
Yes (vs. no)	1.8	1.1-3.0	4.7	0.03	2.4	1.0-5.8	4.8	0.03

Alcohol Consumption Trajectories in Adult Women with HIV Infection

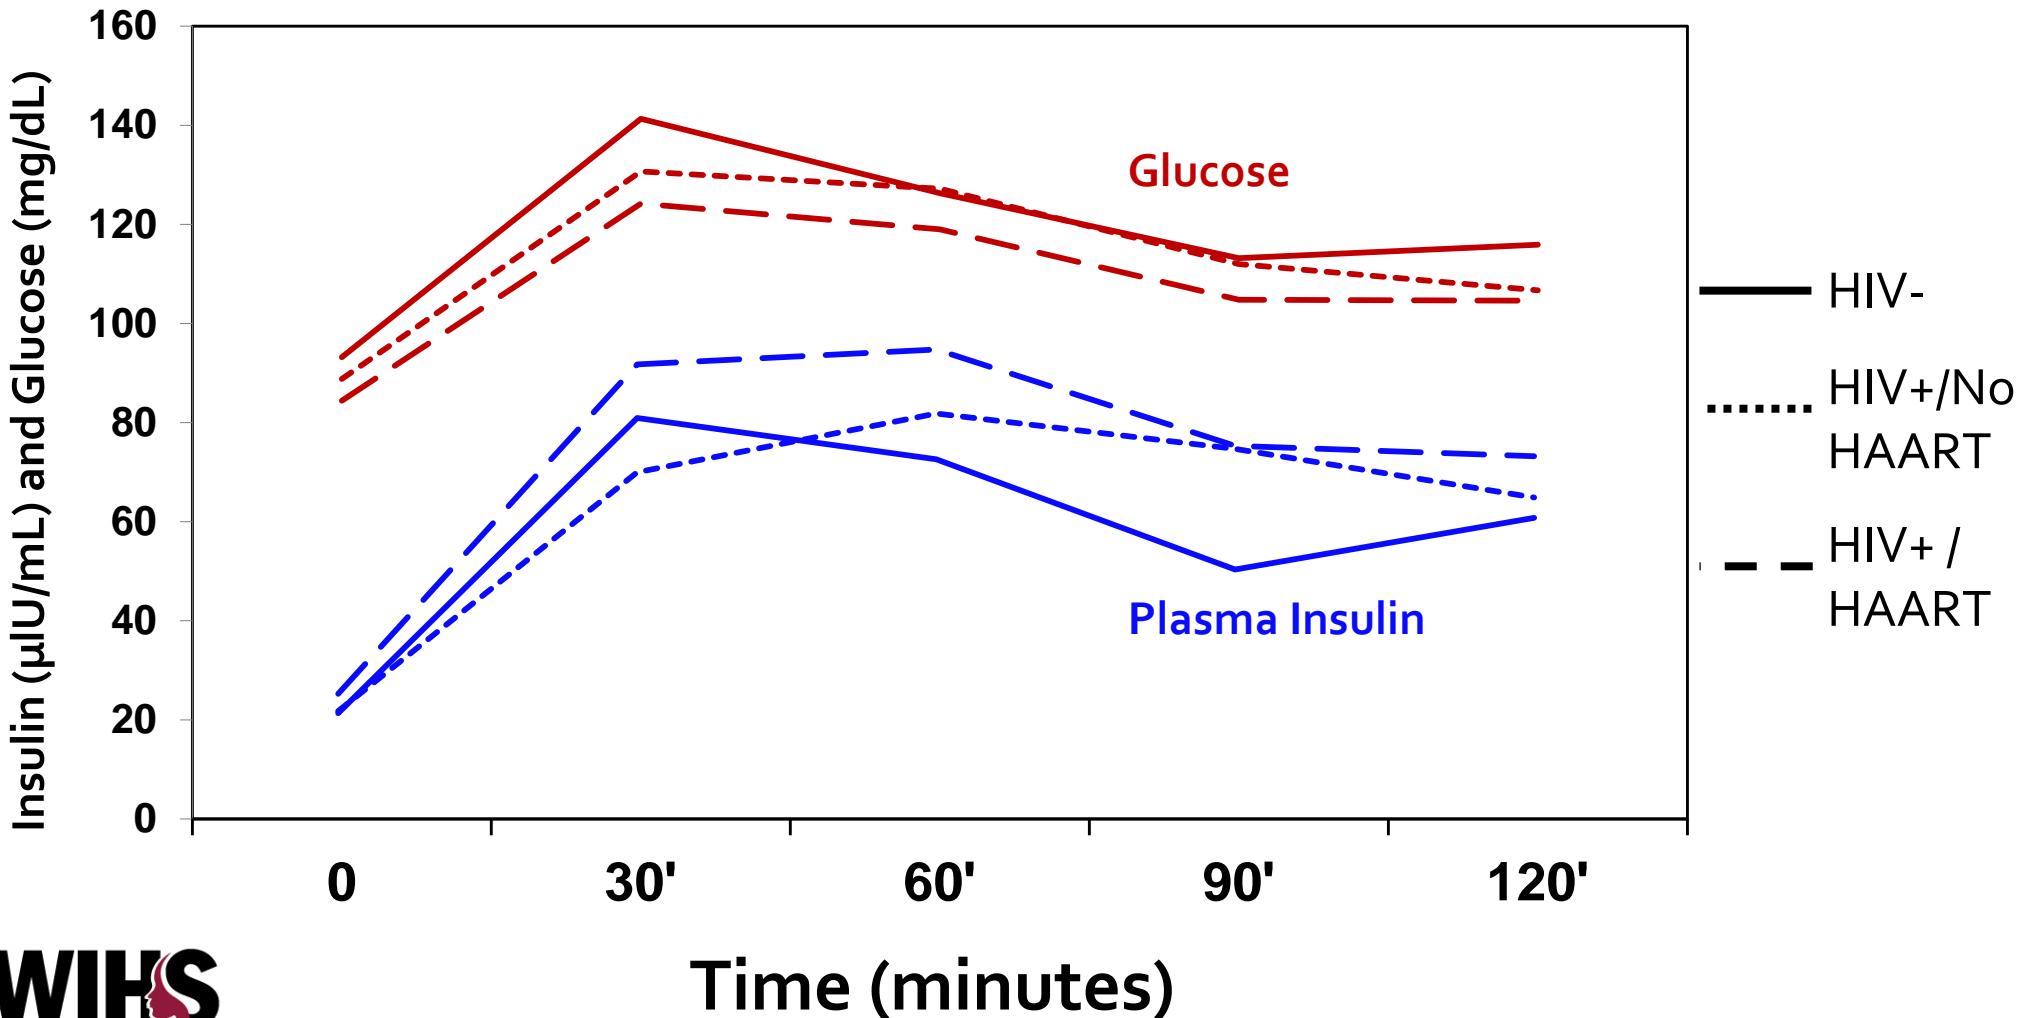

(Cook, Zhu, . . . , Cohen, *AIDS Behav* 2013;17(5):1705-1712)

Among women without heavy drinking at baseline, factors associated with trajectory increasing to heavy drinking over time (compared trajectories that remained non-heavy drinking or non-drinking): multivariable analysis

Baseline Variable	HIV-positive (N = 2,303)				HIV-uninfected (N = 779)			
	Odds ratio	95 % CI	Wald χ^2	p	Odds ratio	95 % CI	Wald χ^2	p
Education								
> High school (vs. ≤ high school)	0.65	0.41-1.04	3.3	0.07	-	-	-	-
Crack/cocaine use								
Yes (vs. no)	3.48	2.33-5.19	37.3	<0.001	3.17	1.88-5.37	21.0	<0.001
Marijuana use								
Yes (vs. no)	2.79	1.89-4.10	27.0	<0.001	3.06	1.86-5.05	24.8	<0.001
Tobacco use								
Yes (vs. no)	2.91	1.74-4.87	16.5	<0.001	2.27	1.25-4.12	6.6	-
Peak drinking history (prior to baseline)								
Non-drinker (reference)	1	-	-	-	1	-	-	-
Moderate drinker	0.36	0.13-1.03	5.4	0.02	0.44	0.15-1.33	5.4	0.02
Heavy drinker	1.51	1.00-2.28	22.0	<0.001	2.40	1.45-3.97	14.4	<0.001
Ever had alcohol treatment (prior to baseline)								
Yes (vs. no)	2.66	1.77-3.99	22.0	<0.001	-	-	-	-
HCV seropositive								
Yes (vs. no)	0.97	0.65-1.43	0.0	0.86	0.97	0.56-1.65	0.0	0.90

Effect of HIV Infection & HAART Use on Oral Glucose Tolerance and Insulin Sensitivity

(Danoff, Shi, . . . , Anastos, *J Acquir Immune Defic Syndr* 2005; 39:55-62)

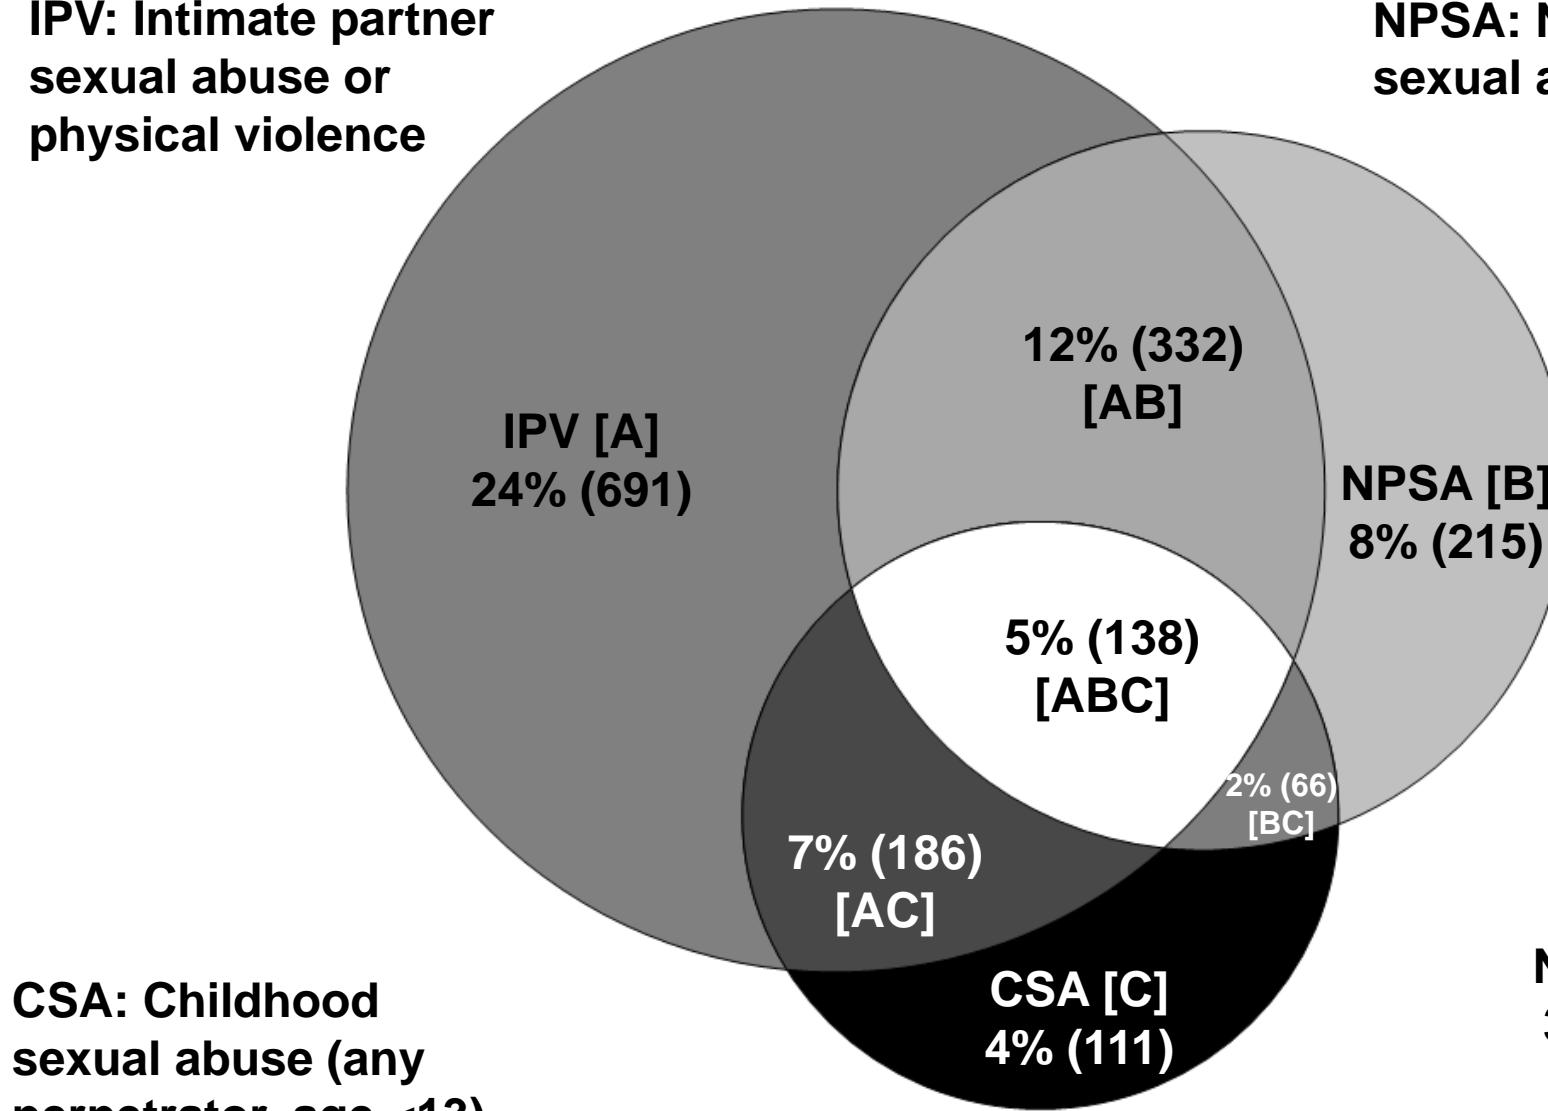

Polyvictimization Exposures in WIHS

(Decker, Benning, ..., Golub, Am J Prev Med 2016; 51:731-742)

IPV: Intimate partner sexual abuse or physical violence

NPSA: Non-partner sexual abuse (age >12)

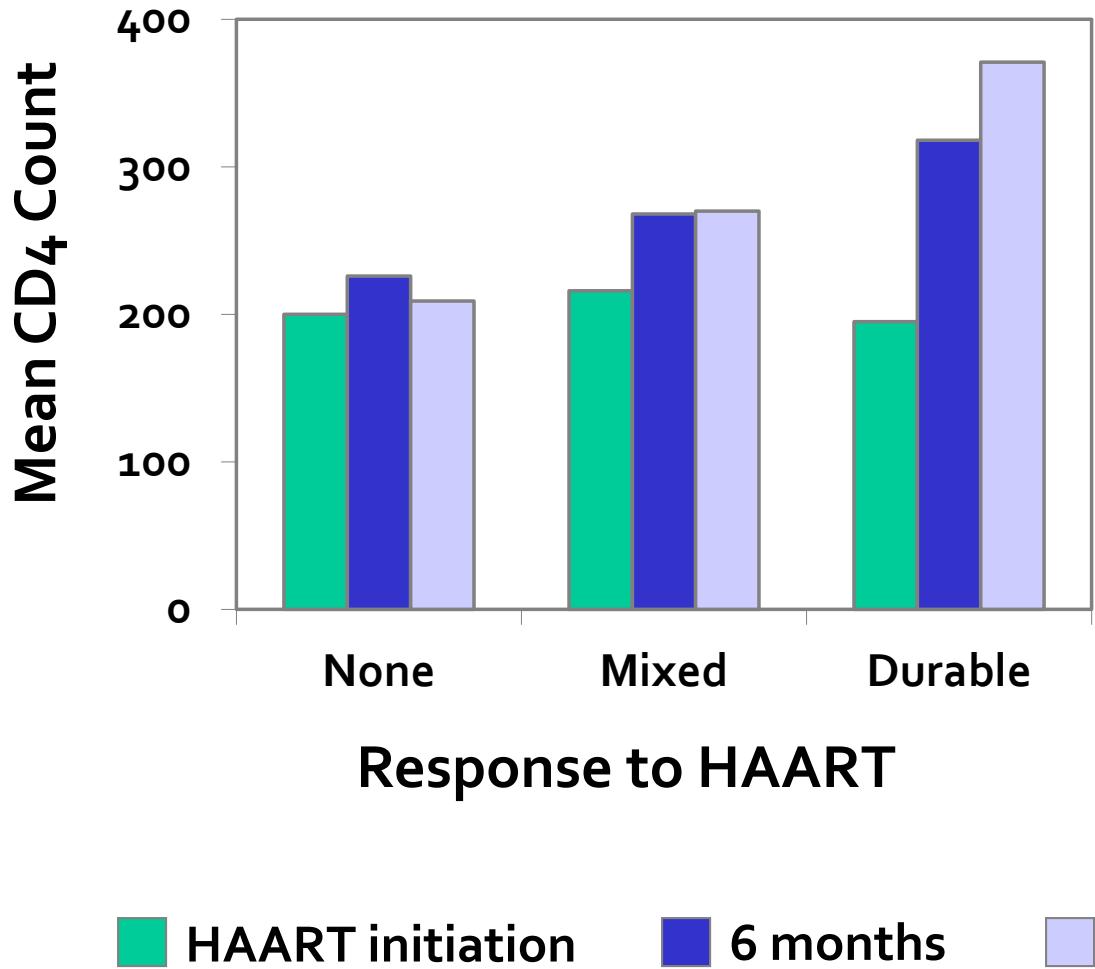

CSA: Childhood sexual abuse (any perpetrator, age <13)

No violence
39% (1099)

Observed CD4 Counts by Response to HAART

(DeHovitz, Kovacs, . . . , Greenblatt, *JID* 2000; 182:1527-1530)

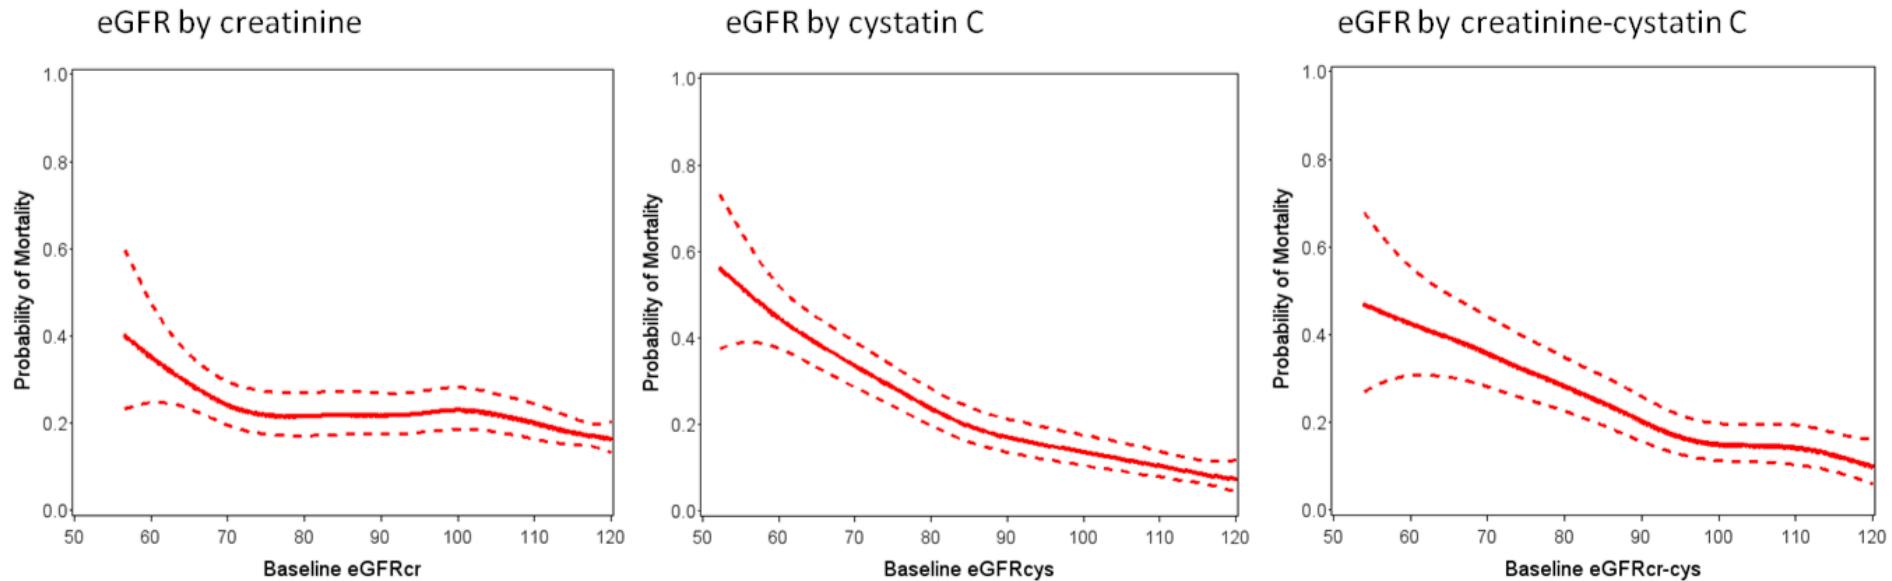

HIV-RNA response at the two follow-up visits:

- ▶ None: < 0.5 log decrease for both visits
- ▶ Mixed: > 1 log decrease, followed by < 0.5 log decrease
- ▶ Durable: > 1 log decrease for both visits

Comparisons of Creatinine and Cystatin C for Detection of Kidney Disease and Prediction of All-cause Mortality in HIV-infected Women

(Driver, Scherzer, . . . , Shlipak, AIDS 2013;27(14):2291-2299)

Association of Baseline eGFR with Mortality among HIV-infected WIHS Participants

Solid lines denote the predicted probability of mortality (with dotted 95% CI bounds) calculated from unadjusted generalized additive models. The lowest 5% of eGFR values and all values above 120 are truncated.

Comparisons of Creatinine and Cystatin C for Detection of Kidney Disease and Prediction of All-cause Mortality in HIV-infected women

(Driver, Scherzer, . . . , Shlipak, AIDS 2013;27(14):2291-2299)

Association of baseline eGFR with all-cause mortality in HIV-infected WIHS participants

	Total Number	Death rate (per 1000 person-years) (95% CI)	Unadjusted HR (95% CI)	Adjusted HR ^a (95% CI)
Creatinine				
>90 ml/min per 1.73 m ²	694	18.9 (15.7-22.7)	Reference	Reference

IBW, ideal body weight.

CD4 Change and HIV RNA Concentration from Baseline to Failure Visit

(Gange, Schneider, . . . , Greenblatt, *J Acquir Immune Defic Syndr* 2006; 41:68-74)

	Estimated Impact on Mean Change (95% CI)	P Value*
Change in CD4⁺ cell count (cells/mm³)		
NRTI resistance at baseline visit	-31.0 (-82.1, 20.1)	0.233
NRTI resistance at failure visit	-14.7 (-71.6, 42.3)	0.611
PI resistance at failure visit	64.4 (14.7, 114.2)	0.012
NNRTI resistance at failure visit		
No baseline NRTI resistance	1.5 (-95.3, 98.2)	0.976
Baseline NRTI resistance	118.3 (38.3, 198.4)	0.004
Log ₁₀ HIV-1 RNA (at failure at visit)	-72.7 (-105.0, -40.4)	<0.001
Change in Log₁₀ HIV RNA (copies/mL)		
NRTI resistance at baseline visit	0.196 (-0.039, 0.432)	0.102
NRTI resistance at failure visit	-0.297 (-0.586, -0.008)	0.044
PI resistance at failure visit	-0.038 (-0.297, 0.222)	0.774
NNRTI resistance at failure visit	-0.013 (-0.346, 0.320)	0.938

*Multivariable model simultaneously adjusting for all listed variables, CD4 cell count and HIV RNA level prior to PI/NNRTI initiation, and type of PI and NNRTI therapies. Changes were standardized by duration between baseline and failure visit.

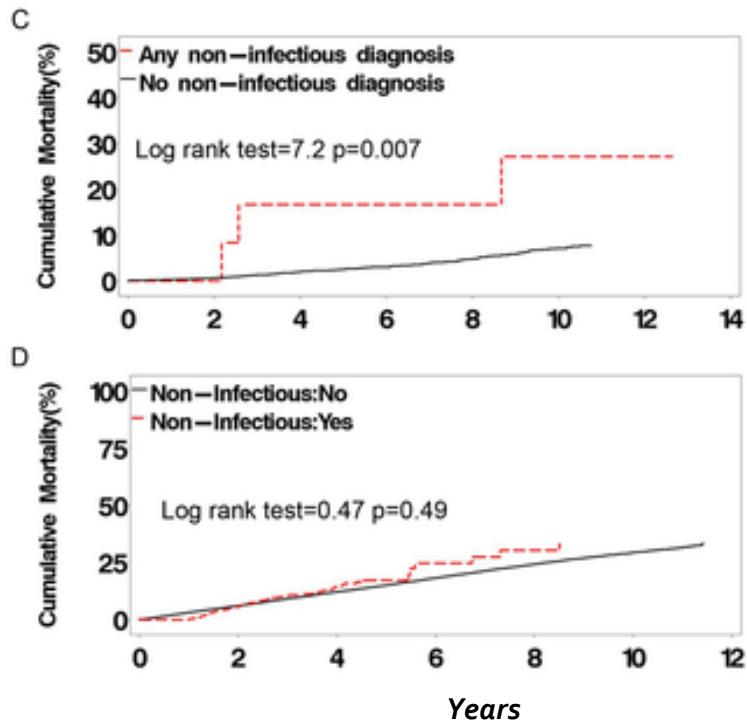

The Impact of HAART on Respiratory Complications of HIV Infection: Longitudinal Trends in the MACS and WIHS Cohorts

(Gingo, Balasubramani, . . . , Morris, PLoS One; 2013;8(3):e58812)

MACS

WIHS

Unadjusted cumulative HAART era mortality.

Unadjusted Kaplan-Meier mortality curves starting during the HAART era for HIV-infected participants who had any infectious respiratory disease vs. those who never had any infectious disease in the MACS (A) and WIHS (B) cohorts and for HIV-infected participants who had any non-infectious respiratory disease vs. those who never had any non-infectious disease in the MACS (C) and WIHS (D) cohorts. Time zero represents the start of the HAART era or seroconversion for participants who seroconverted during the HAART era.

Pulmonary Symptoms and Diagnoses are Associated with HIV in the MACS and WIHS Cohorts

(Gingo, Balasubramani, . . . , Morris, *BMC Pulm Med* 2014;14:75)

Estimates for the Effect of HIV Infection on Incidence of Pulmonary Diagnoses

Diagnosis	MACS			WIHS				
	HIV-infected	HIV-uninfected	Incident rates per 100 person-years	RR (95% CI)	p-value	Incident rates per 100 person-years	RR (95% CI)	p-value
Asthma	0.69	0.62	0.86 (0.35-2.13)	0.75	2.59	3.35	0.87 (0.54-1.41)	0.58
COPD	1.70	0.69	2.21 (1.09-4.50)	0.03	2.13	1.39	1.58 (0.85-2.94)	0.15
Sleep apnea	1.41	1.45	0.92 (0.49-1.73)	0.81	1.12	0.49	2.33 (0.89-6.11)	0.09

Adjusted for age, race smoking status and intravenous drug use.

MACS - Multicenter Aids Cohort Study; WIHS - Women's Interagency HIV Study; RR = Rate ratio; CI - confidence interval; COPD - chronic obstructive pulmonary disease.

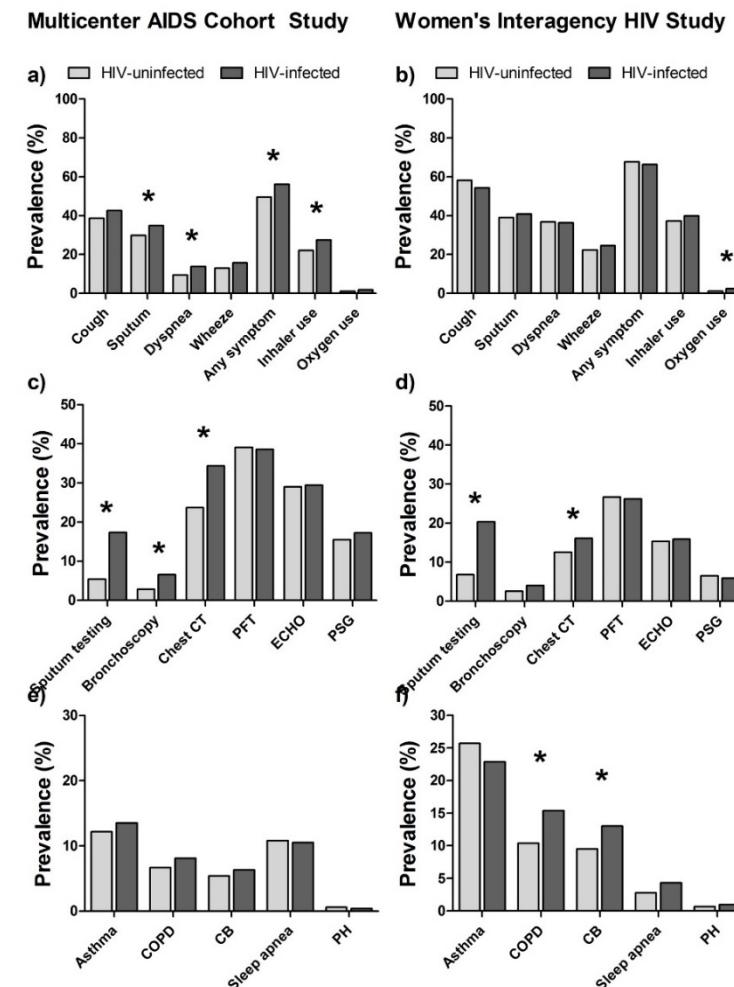

Pulmonary Symptoms and Diagnoses are Associated with HIV in the MACS and WIHS Cohorts

(Gingo, Balasubramani, . . . , Morris, *BMC Pulm Med* 2014;14:75)

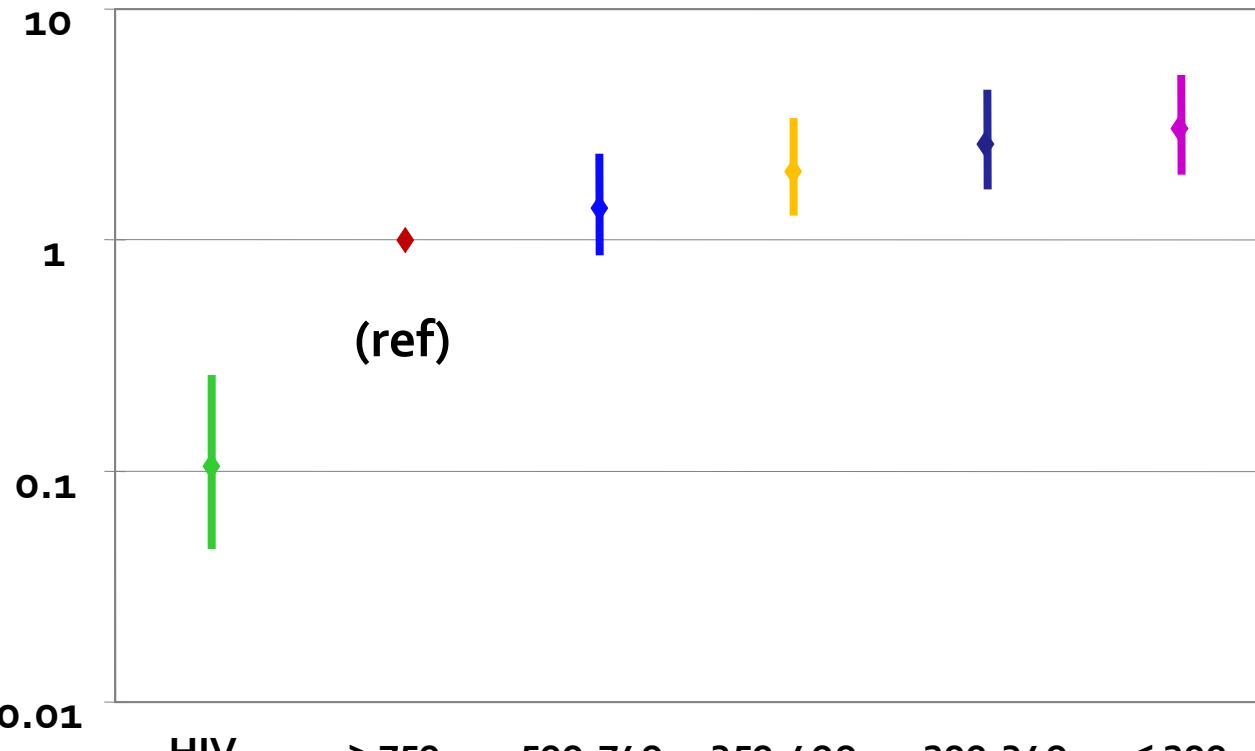

Prevalence of respiratory symptoms in the Multicenter AIDS Cohort (MACS) (a) and Women's Interagency HIV Study (WIHS) (b), diagnostic testing in MACS (c) and WIHS (d), and respiratory diagnoses in MACS (e) and WIHS (f) by HIV status.

ECHO - echocardiogram, CT - computed tomography, PFT - pulmonary function testing, PSG - polysomnography, COPD - chronic obstructive pulmonary disease, CB - chronic bronchitis, PH - pulmonary hypertension. (*) represents a p-value < 0.05 by chi-square test.

Risk of Herpes Zoster by CD4 Cell Count in HIV+ versus HIV- Women

(Glesby, Hoover, . . . , Anastos, *J Acquir Immune Defic Syndr* 2004; 37:1604-1609)

Diamonds

time on study.

Baseline Characteristics Associated with Tobacco Cessation (1)

(Goldberg, Weber, . . . , Cohen, *J Gen Intern Med* 2010; 25:39-44)

BL Characteristics	Adjusted OR	95% CI	P for trend
Ethnicity and race			
Non-Hispanic black	1.00		
Non-Hispanic white	1.53	0.85-2.75	
Hispanic	2.07	1.28-3.35	
Education			
Less than HS	1.00		
HS graduate	1.37	1.06-1.76	0.02
Beyond HS	1.87	1.13-3.12	

Variables included in the multivariate model include study center; ethnicity; education; CES-D score; crack, cocaine, or heroin use; average number of cigarettes/day; and number of years since beginning smoking.

Baseline Characteristics Associated with Tobacco Cessation (2)

(Goldberg, Weber, . . . , Cohen, *J Gen Intern Med* 2010; 25:39-44)

BL Characteristics	Adjusted OR	95% CI	P for trend
Crack/cocaine/heroin use			
Never	1.00		
Former	0.65	0.49-0.86	0.003
Current	0.43	0.24-0.74	
Cigarettes smoked/day			
≤10	1.00		
11-20	0.50	0.34-0.74	<0.001
>20	0.25	0.12-0.55	

Variables included in the multivariate model include study center; ethnicity; education; CES-D score; crack, cocaine, or heroin use; average number of cigarettes/day; and number of years since beginning smoking.

Factors Associated with CD4 after HAART

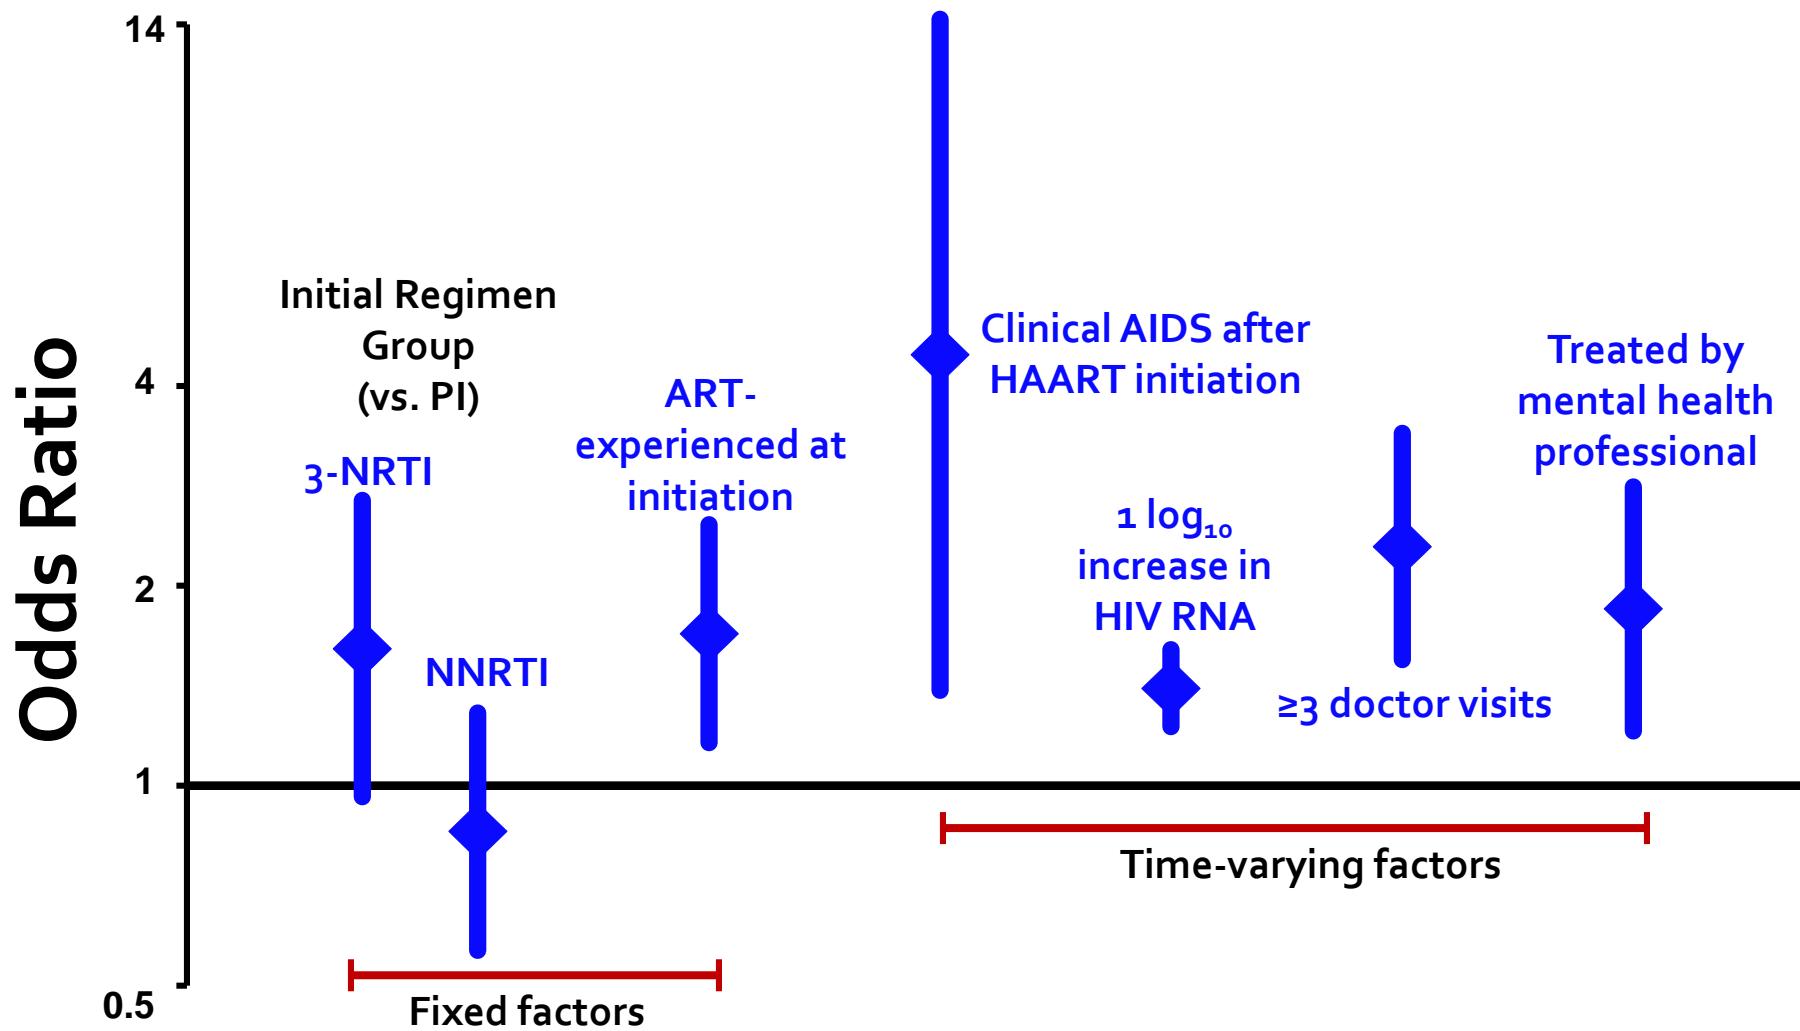

(Golub, Benning, . . . , Gange, *Clin Infect Dis* 2008; 46:305-312)

Time after HAART initiation & factor	Mean CD4 cells/mL	Mean CD4 diff. (95% CI)	P
Y E A R 1	Initial regimen group		
	PI	438	Reference ...
	NNRTI	460	23 (-26 to 72) 0.35
	3-NRTI	369	-90 (-155 to -26) 0.006
	Initiated 4/1/02-3/31/05 ^a	...	27 (-255 to 309) 0.85
	Last pre-HAART CD4	...	39 (21 to 56) <0.001
	Nadir CD4	...	79 (52 to 106) <0.001
	Peak HIV RNA (per log ₁₀)	...	0 (-34 to 34) 1.00
	Concurrent VL < LOQ ^b	...	113 (54-173) <0.001
Y E A R 2	Initial regimen group		
	PI	483	Reference ...
	NNRTI	454	-54 (-107 to 0) 0.05
	3-NRTI	398	-104 (-174 to -34) 0.004
	Initiated 4/1/02-3/31/05 ^a	...	-198 (-519 to 122) 0.22
	Last pre-HAART CD4	...	17 (-3 to 38) 0.10
	Nadir CD4	...	69 (40 to 98) <0.001
	Peak HIV RNA (per log ₁₀)	...	-30 (-65 to 6) 0.10
	Concurrent VL < LOQ ^b	...	169 (107 to 231) <0.001

^a Versus period 4/1/00-3/31/02. ^b LOQ – limit of quantitation.

Predictors of First Switch after HAART Initiation*

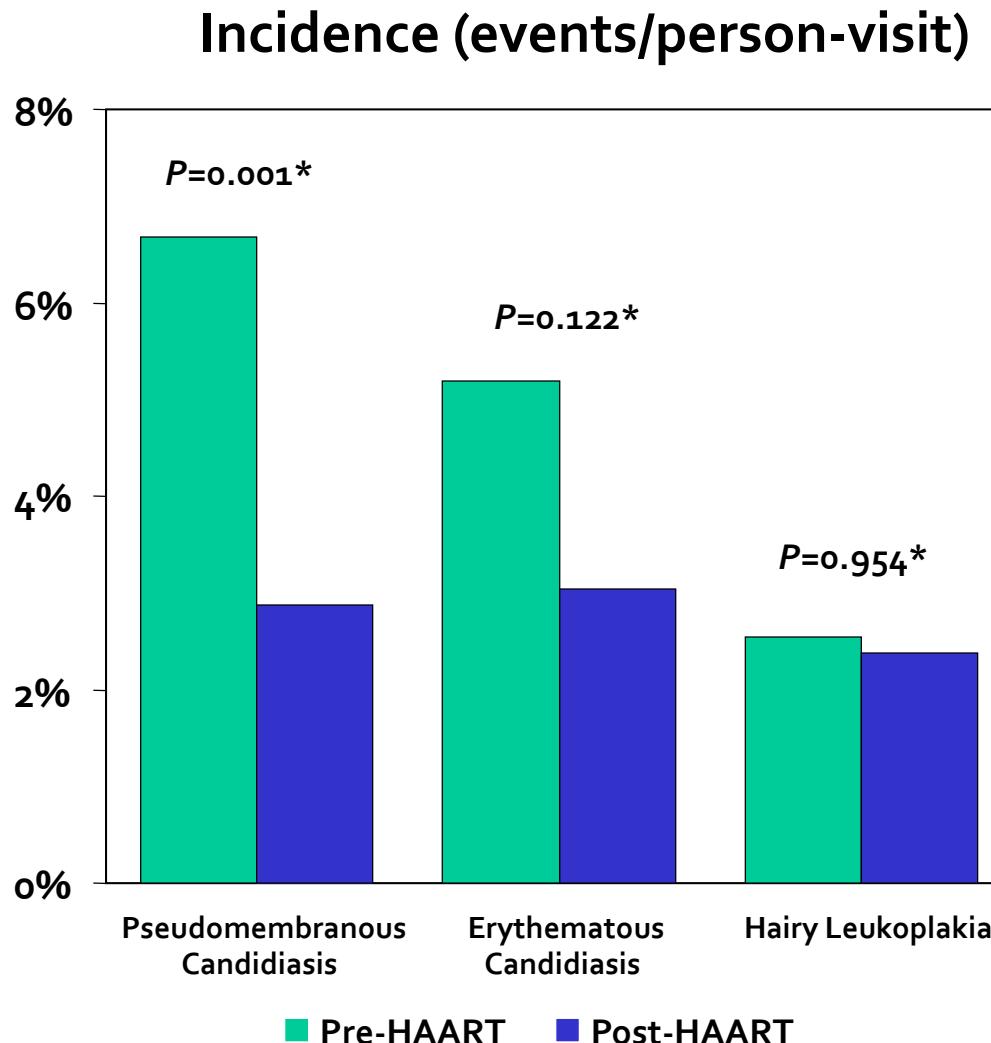

(Golub, Benning, . . . , Gange, *Clin Infect Dis* 2008; 46:305-312)

* Switch to a different regimen type, to a non-HAART regimen, or discontinue all ART.

Incidence of Oral Mucosal Lesions in WIHS

(Greenspan, Gange, . . . , Greenspan, *JDR* 2004; 83:145-150)

Multivariate* Correlates of Incident Candidiasis:

- HIV RNA > 40,000
- Smoking
- Heroin/methadone

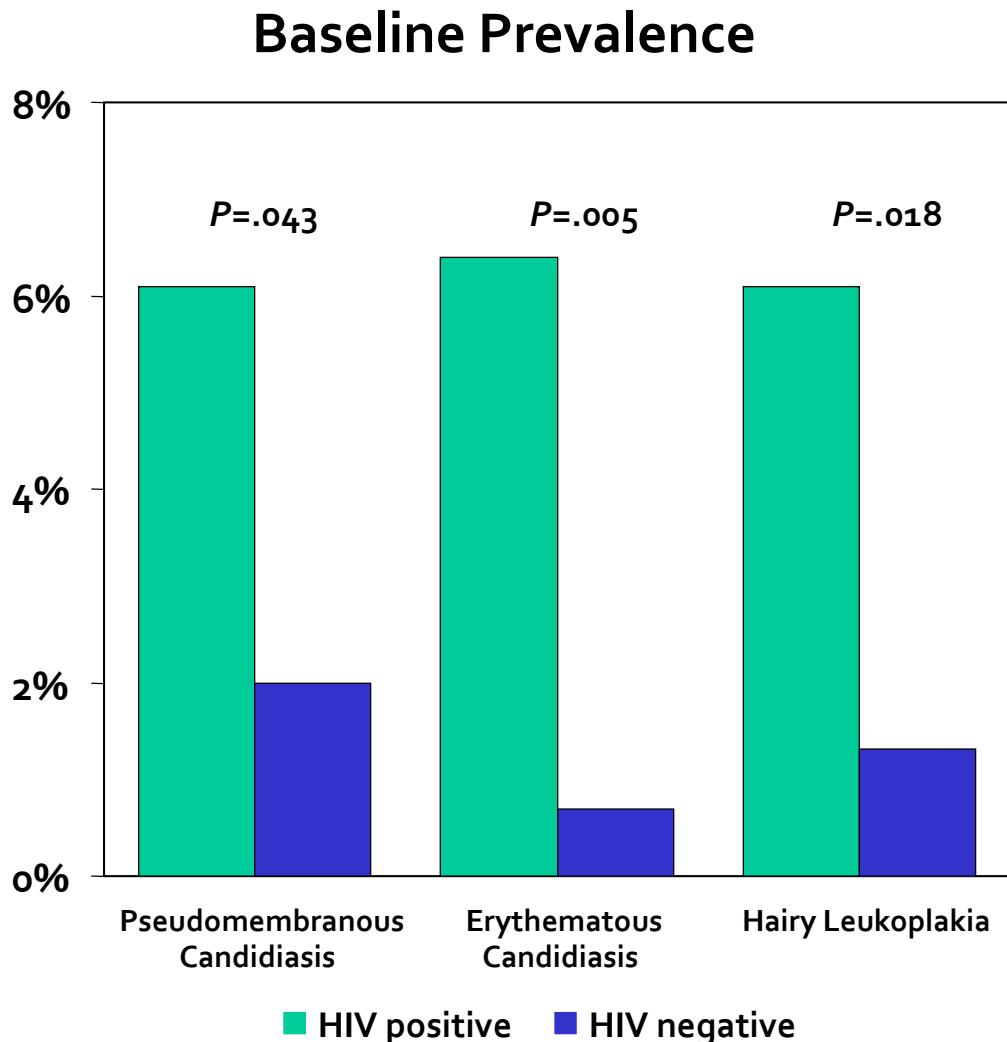

Multivariate* Correlates of Incident Hairy Leukoplakia:

- HIV RNA > 4,000
- CD4 < 350

*Adjusted for CD4, HIV RNA, antifungal use, smoking, marijuana, heroin/methadone.

Prevalence of Oral Mucosal Lesions in WIHS

(Greenspan, Komaroff, . . . , Greenspan, *J Acquir Immune Defic Syndr* 2000; 25:44-50)

Multivariate* Correlates of Candidiasis:

- CD4 < 200
- HIV RNA > 50,000
- Smoking
- Heroin/methadone

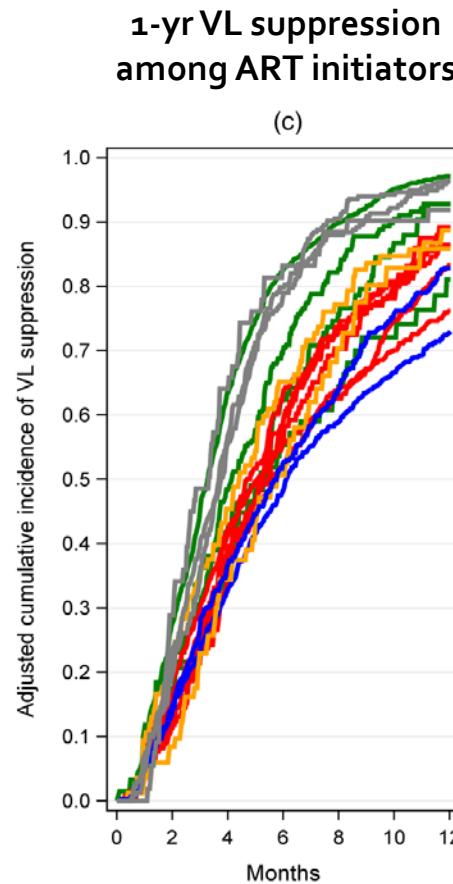

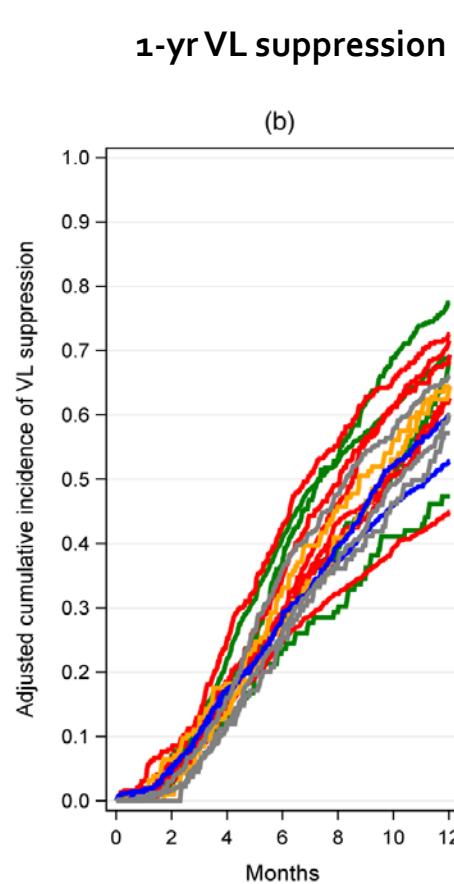

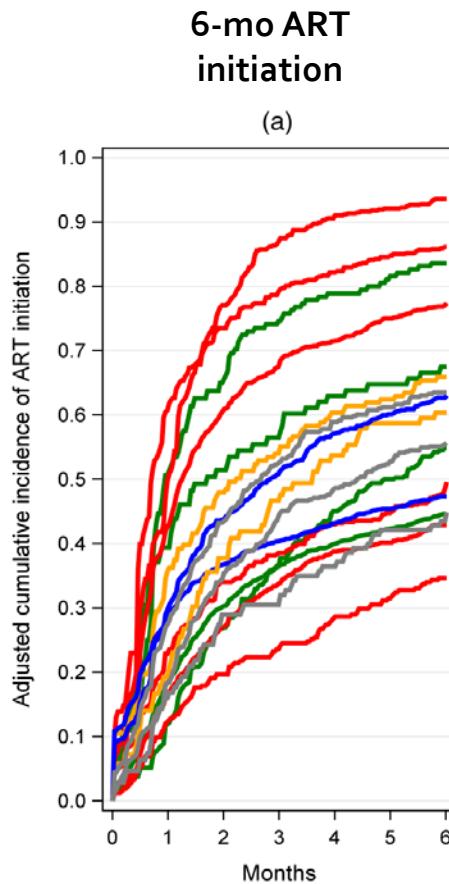

Multivariate* Correlates of Hairy Leukoplakia:

- HIV RNA > 50,000

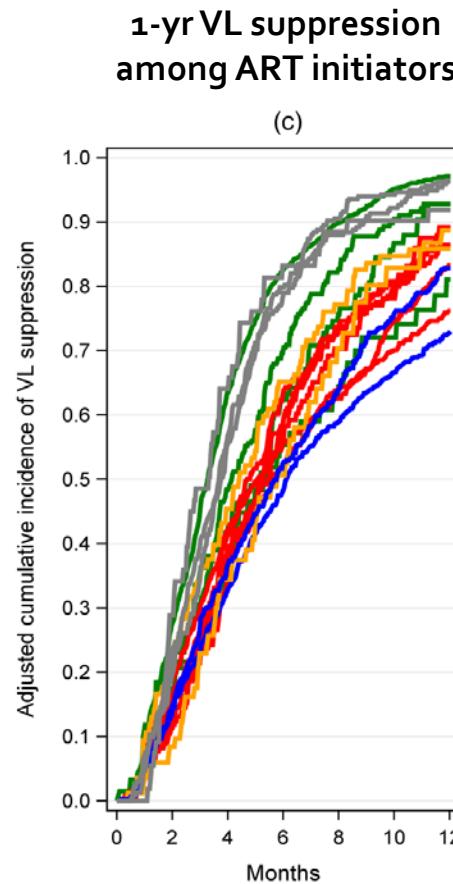

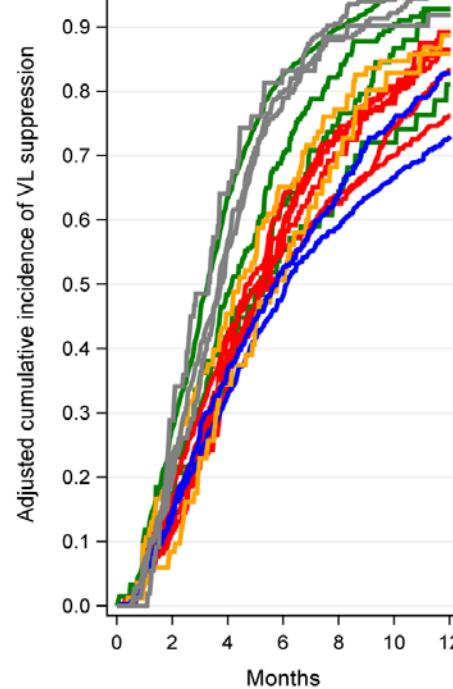

*Adjusted for CD4, HIV RNA, antifungal use, ART, smoking, marijuana, heroin/methadone, genital herpes, vaginal candidiasis.

Trends and Disparities in Antiretroviral Therapy Initiation and Virologic Suppression among Newly Treatment-eligible HIV-infected Individuals in North America, 2001-2009

(Hanna, Buchacz, . . . , Gange, *Clin Infect Dis* 2013;56(8):1174-1182)

Southern US
Northeast US
Western US
Canada

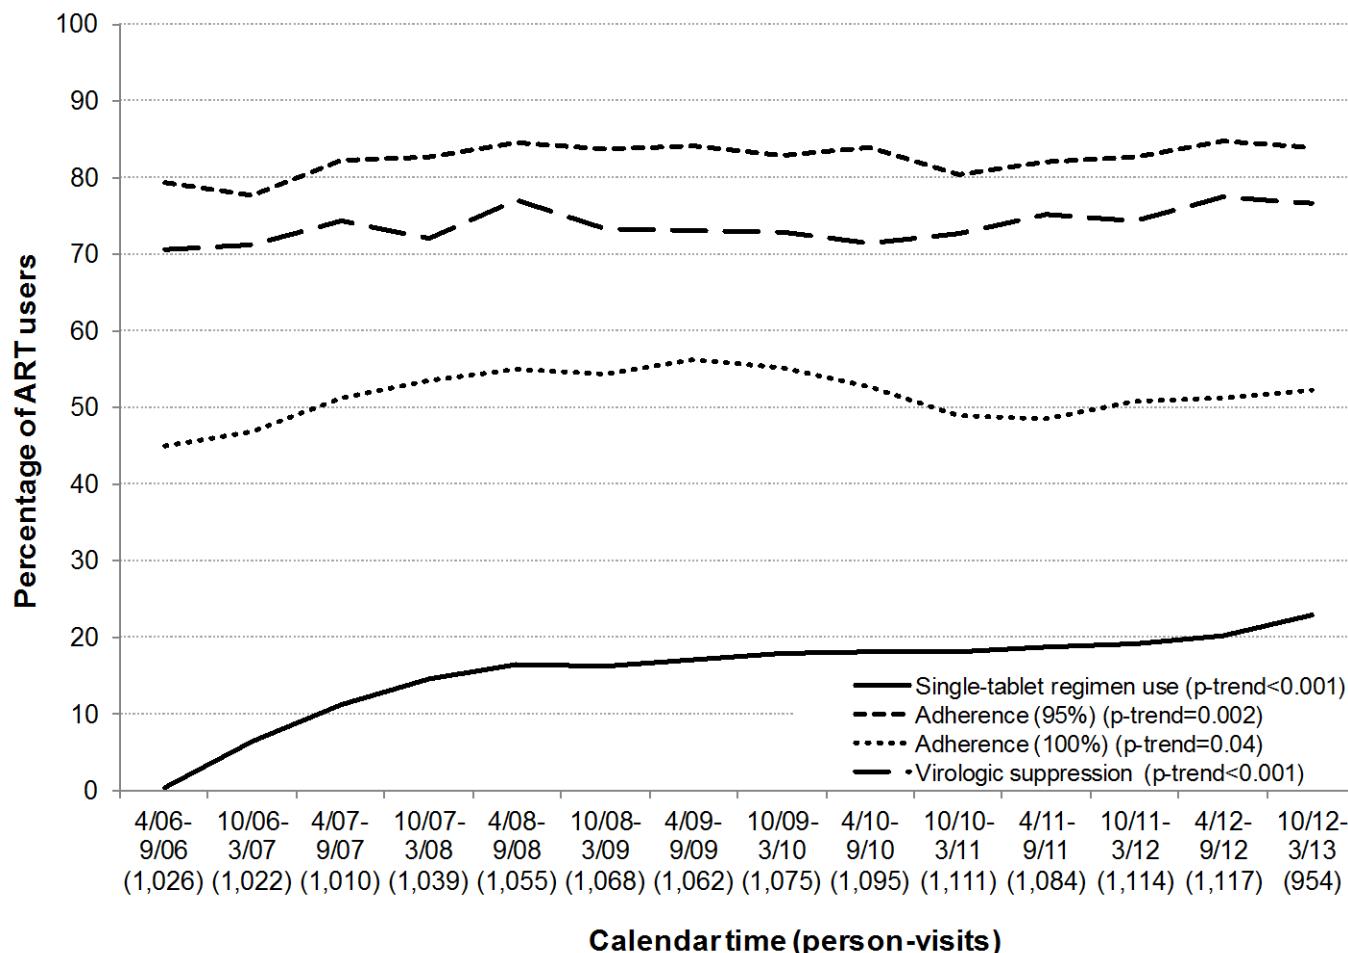

Estimates were adjusted for age; race/ethnicity; sex; transmission risk; documented history of non-injection drug abuse, alcohol abuse, and mental illness; CD4+ count and viral load at eligibility; calendar year; type of cohort; and clinic-specific mechanisms undertaken to assist with access to ART. $P_{\text{heterogeneity}} < 0.001$ for all three.

Increase in Single-tablet Regimen Use and Associated Improvements in Adherence-related Outcomes

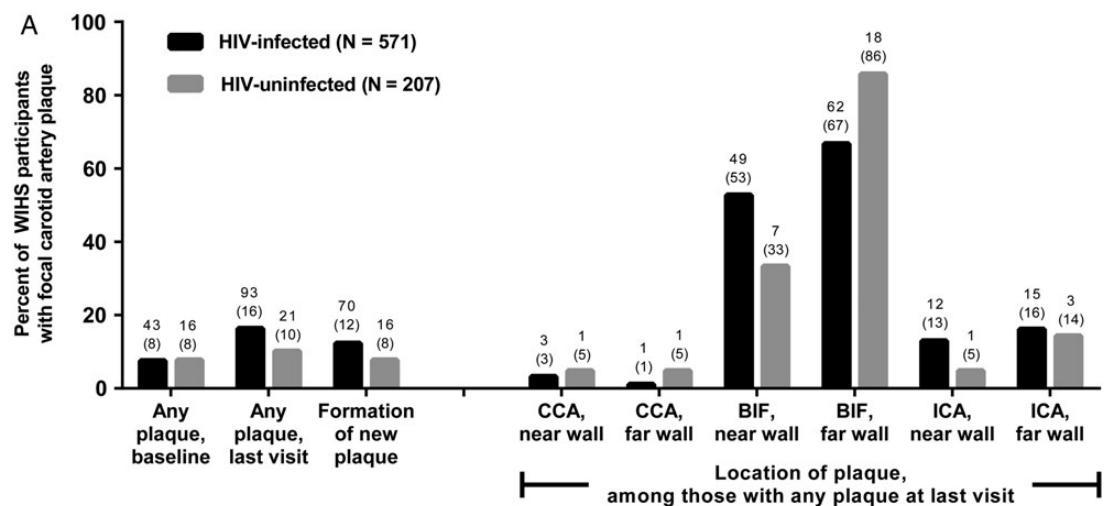

(Hanna, Hessol, . . . , Kaplan, JAIDS 2014;65(5):587-596)

Trends in single-tablet regimen use, adherence, and virologic suppression among ART users, Women's Interagency HIV Study, 2006-2013

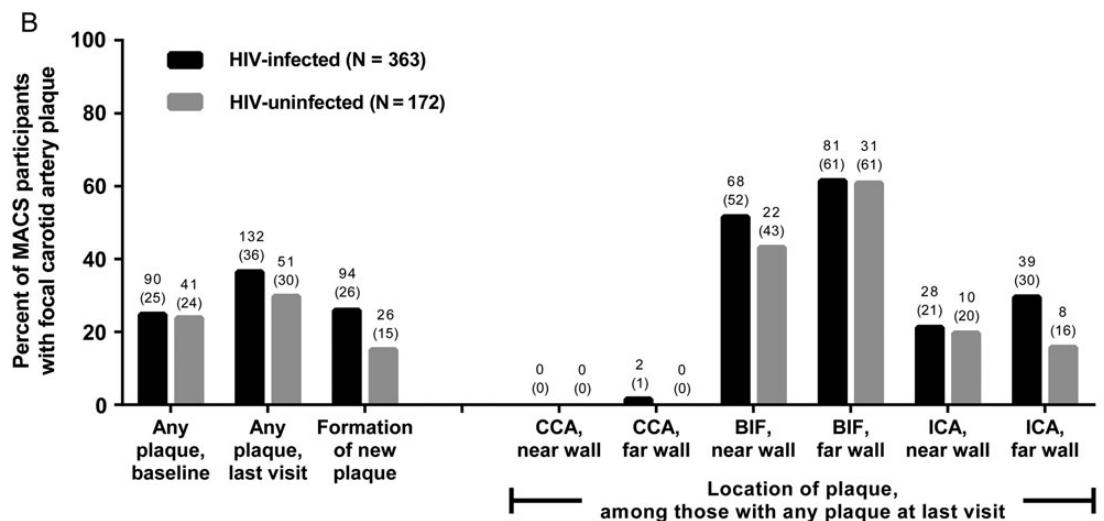

HIV Infection is Associated with Progression of Subclinical Carotid Atherosclerosis

(Hanna, Post, . . . , Kingsley, *Clin Infect Dis* 2015; 61(4):640-650)

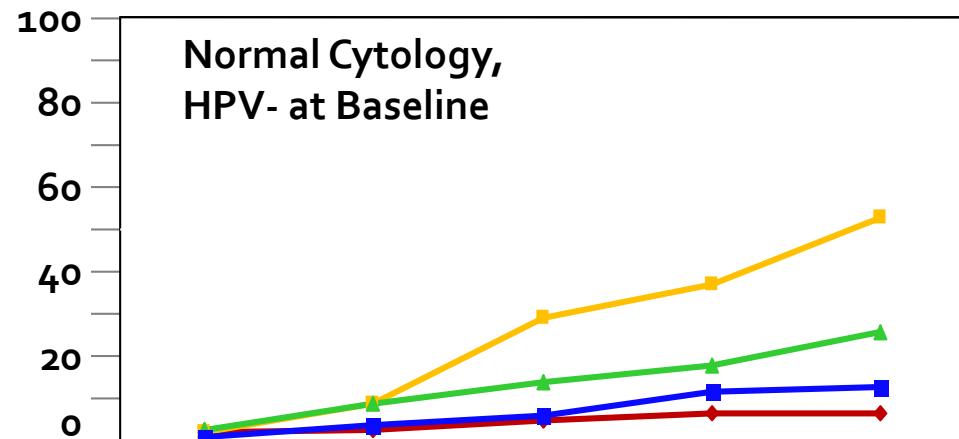

Distribution of focal carotid artery plaque by human immunodeficiency virus (HIV) serostatus, among (A) WIHS, and (B) MACS participants

Cumulative Incidence of Squamous Intraepithelial Lesion by HIV Serostatus and CD4 Count

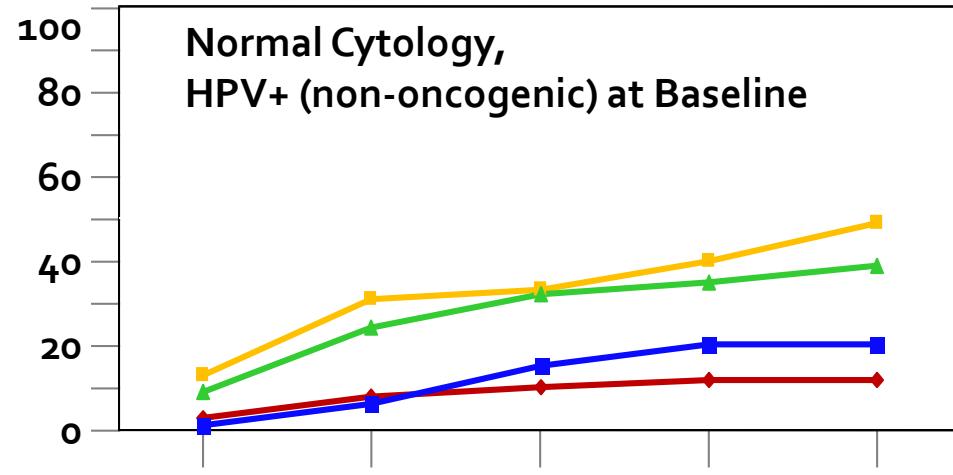

(Harris, Burk, . . . , Strickler, JAMA 2005; 293:1471-1476)

Cumulative Incidence of Any SIL

Baseline HIV and CD4 Count Status

- HIV+, CD4 < 200
- HIV+, CD4 200-500
- HIV+, CD4 > 500
- HIV-

Normal Cytology,
HPV+ (oncogenic) at Baseline

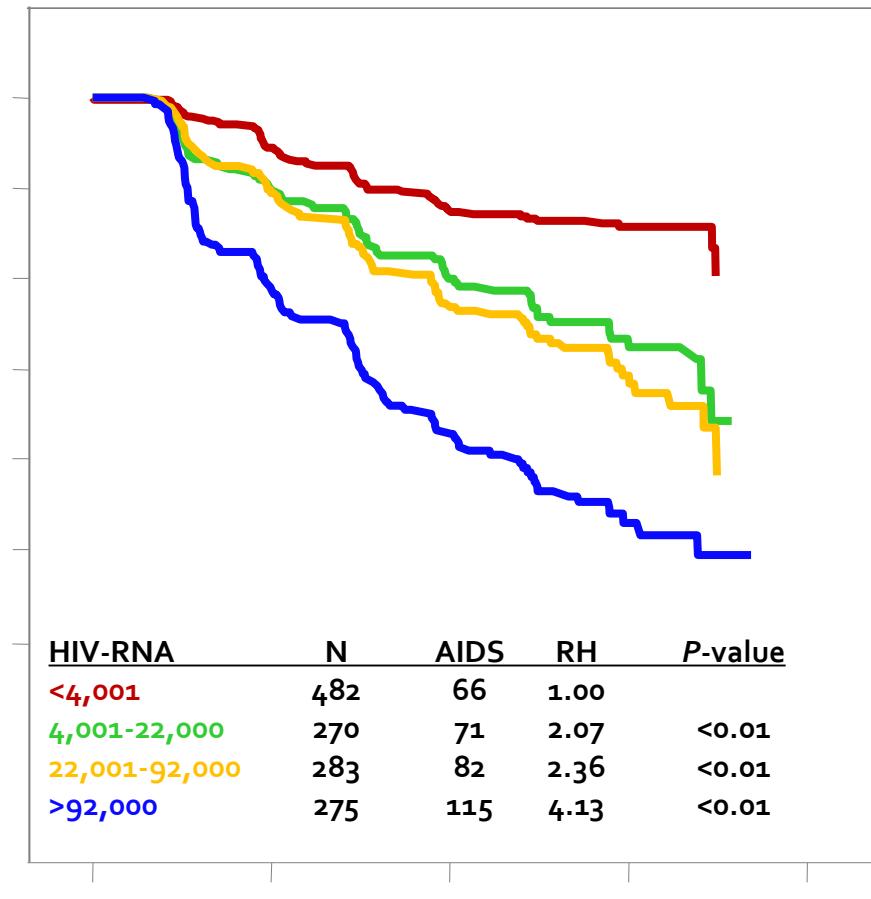

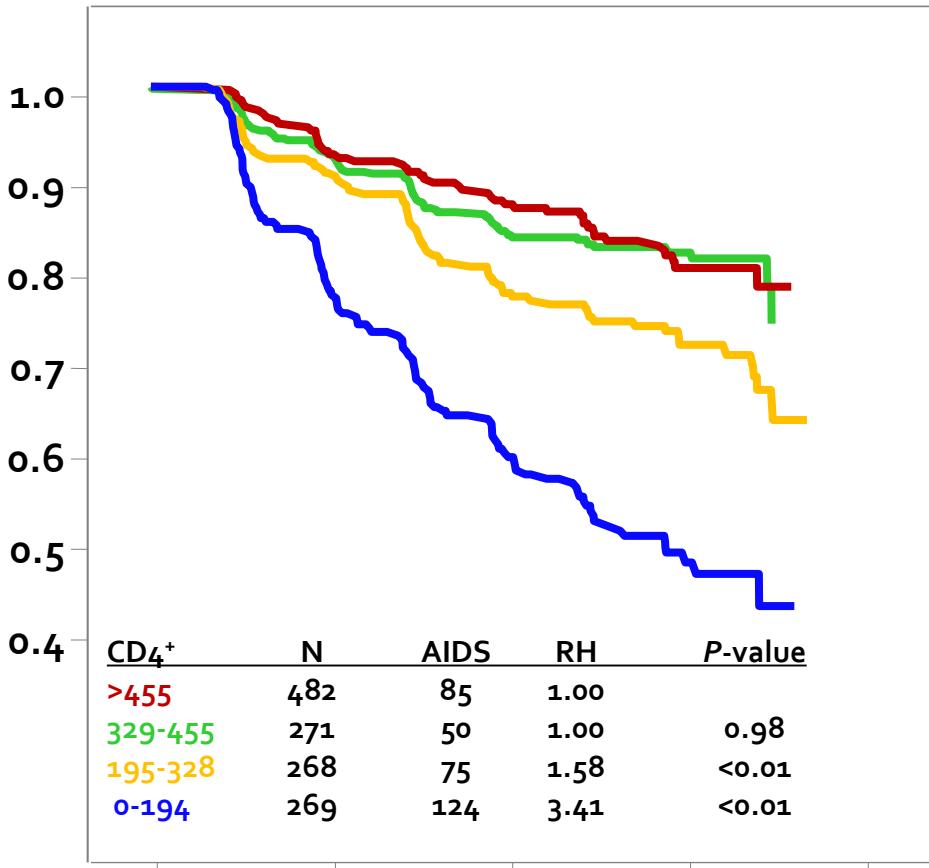

Time Interval (in years)

Time Interval (in years)

Time to Self-reported Clinical AIDS by CD4⁺ and HIV RNA

(Hessol, Anastos, . . . , Gange, *AIDS Res Hum Retrovir* 2000; 16:1105-1112)

Percent AIDS-free

Accident- and Injury-related Causes of Death in MACS and WIHS

(Hessol, Kalinowski, . . . , Cohen, *Clin Infect Dis* 2007; 44:287-294)

Cause of Death	MACS			WIHS		
	HIV+	HIV-	ALL	HIV+	HIV-	ALL
Suicide	5 (21)	5 (19)	10 (20)	1 (3)	2 (20)	3 (7)
Poisoning / Drug OD	7 (29)	6 (22)	13 (25)	26 (72)	5 (50)	31 (67)
Drowning	1 (4)	2 (7)	3 (6)	2 (6)	1 (10)	3 (7)
Assault / homicide	3 (13)	6 (22)	9 (18)	5 (14)	1 (10)	6 (13)
Suffocation	1 (4)	1 (4)	2 (4)	0	0	0
Other injury accidents	7 (29)	7 (26)	14 (27)	2 (6)	1 (10)	3 (7)
Total accident / injury	24	27	51	36	10	46
All other causes	1721	58	1779	554	19	573

NOTE: Data are number of participants (% of total accident/injury deaths).

Lung Cancer Incidence and Survival among HIV-infected and Uninfected Women and Men

(Hessol, Martínez-Maza, . . . , Seaberg, *AIDS* 2015;29(10):1183-1193)

	Baseline		Lung cancer incidence			P value
	N	%	N	P-yrs	IR per 100 000	
Cohort						
WIHS	2549 ^a	37	37 ^b	24376	151.8	<0.0001
MACS	4274	63	23 ^c	45362	50.7	
HIV status						
Infected	3735	55	46	38645	119.0	0.001
Uninfected	3088	45	14	31093	45.0	
Total	6823	100	60	69738	86.0	

CI, confidence interval; IR, incidence rate; MACS, Multicenter AIDS Cohort Study; P-yrs, person-years; WIHS, Women's Interagency HIV Study.

^a Excludes 3 WIHS participants with lung cancer diagnosed prior to enrollment

^b Includes 31 HIV-infected and 6 HIV-uninfected women

^c Includes 15 HIV-infected and 8 HIV-uninfected men

Standardized Incidence Ratios for Cancer in the HAART and Pre-HAART Eras among 1559 HIV+ Women

(Hessol, Seaberg, . . . , Levine, *J Acquir Immune Defic Syndr* 2004; 36:978-985)

Person-years:	Years 1994 – 1996			Years 1997 – 2001		
	2,492	SIR	95% CI*	5,417	SIR	95% CI*
Cancer site/type	Observed	SIR	95% CI*	Observed	SIR	95% CI*
AIDS Cancers	13	23.4	12.5 – 37.7	6	4.4	1.6 – 8.6
NHL	9	53.4	24.4 – 93.6	3	6.4	1.3 – 15.5
KS	4	316.1	86.1 – 692.7	2	189.3	22.9 – 527.3
Non-AIDS Cancers	7	1.4	0.6 – 2.6	15	1.0	0.6 – 1.5
Lung/larynx	2	6.8	0.8 – 18.9	6	6.2	2.3 – 12.1
Breast	1	0.4	0.01 – 1.6	4	0.5	0.1 – 1.2

* The 95% confidence intervals (CI) are based on exact statistical methods.

Poisson Regression Comparison of the Incidence Rates for Cancer among 1559 HIV+ Women

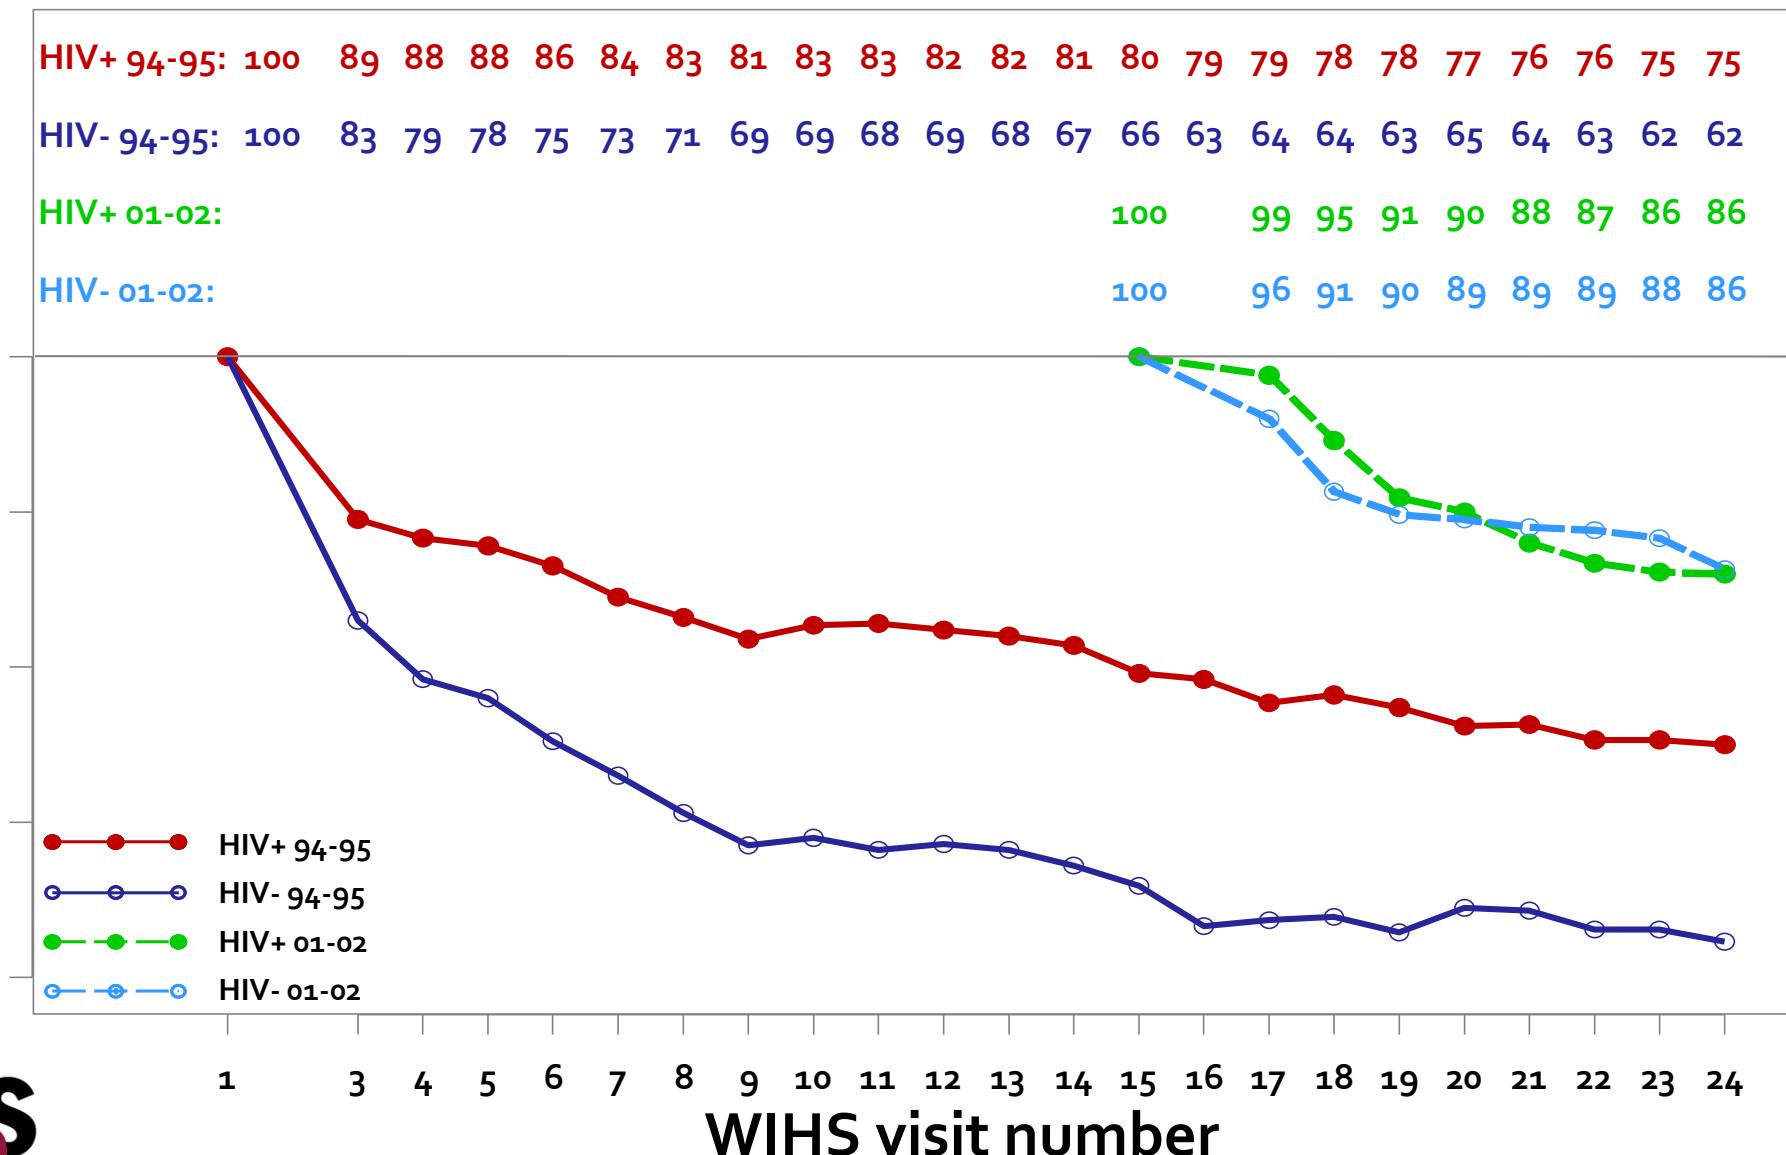

(Hessol, Seaberg, . . . , Levine, *J Acquir Immune Defic Syndr* 2004; 36:978-985)

Cancer site/type	Rate Ratio	95% CI	P-value*
AIDS Cancers	0.21	0.07 – 0.60	0.002
NHL	0.15	0.03 – 0.61	0.005
KS	0.23	0.02 – 1.60	0.17
Non-AIDS Cancers	0.99	0.38 – 2.86	1.0
Lung/larynx	1.38	0.25 – 13.98	1.0
Breast	1.84	0.18 – 90.62	0.99

* The 95% CI and p-value are based on exact statistical methods for Poisson regression.

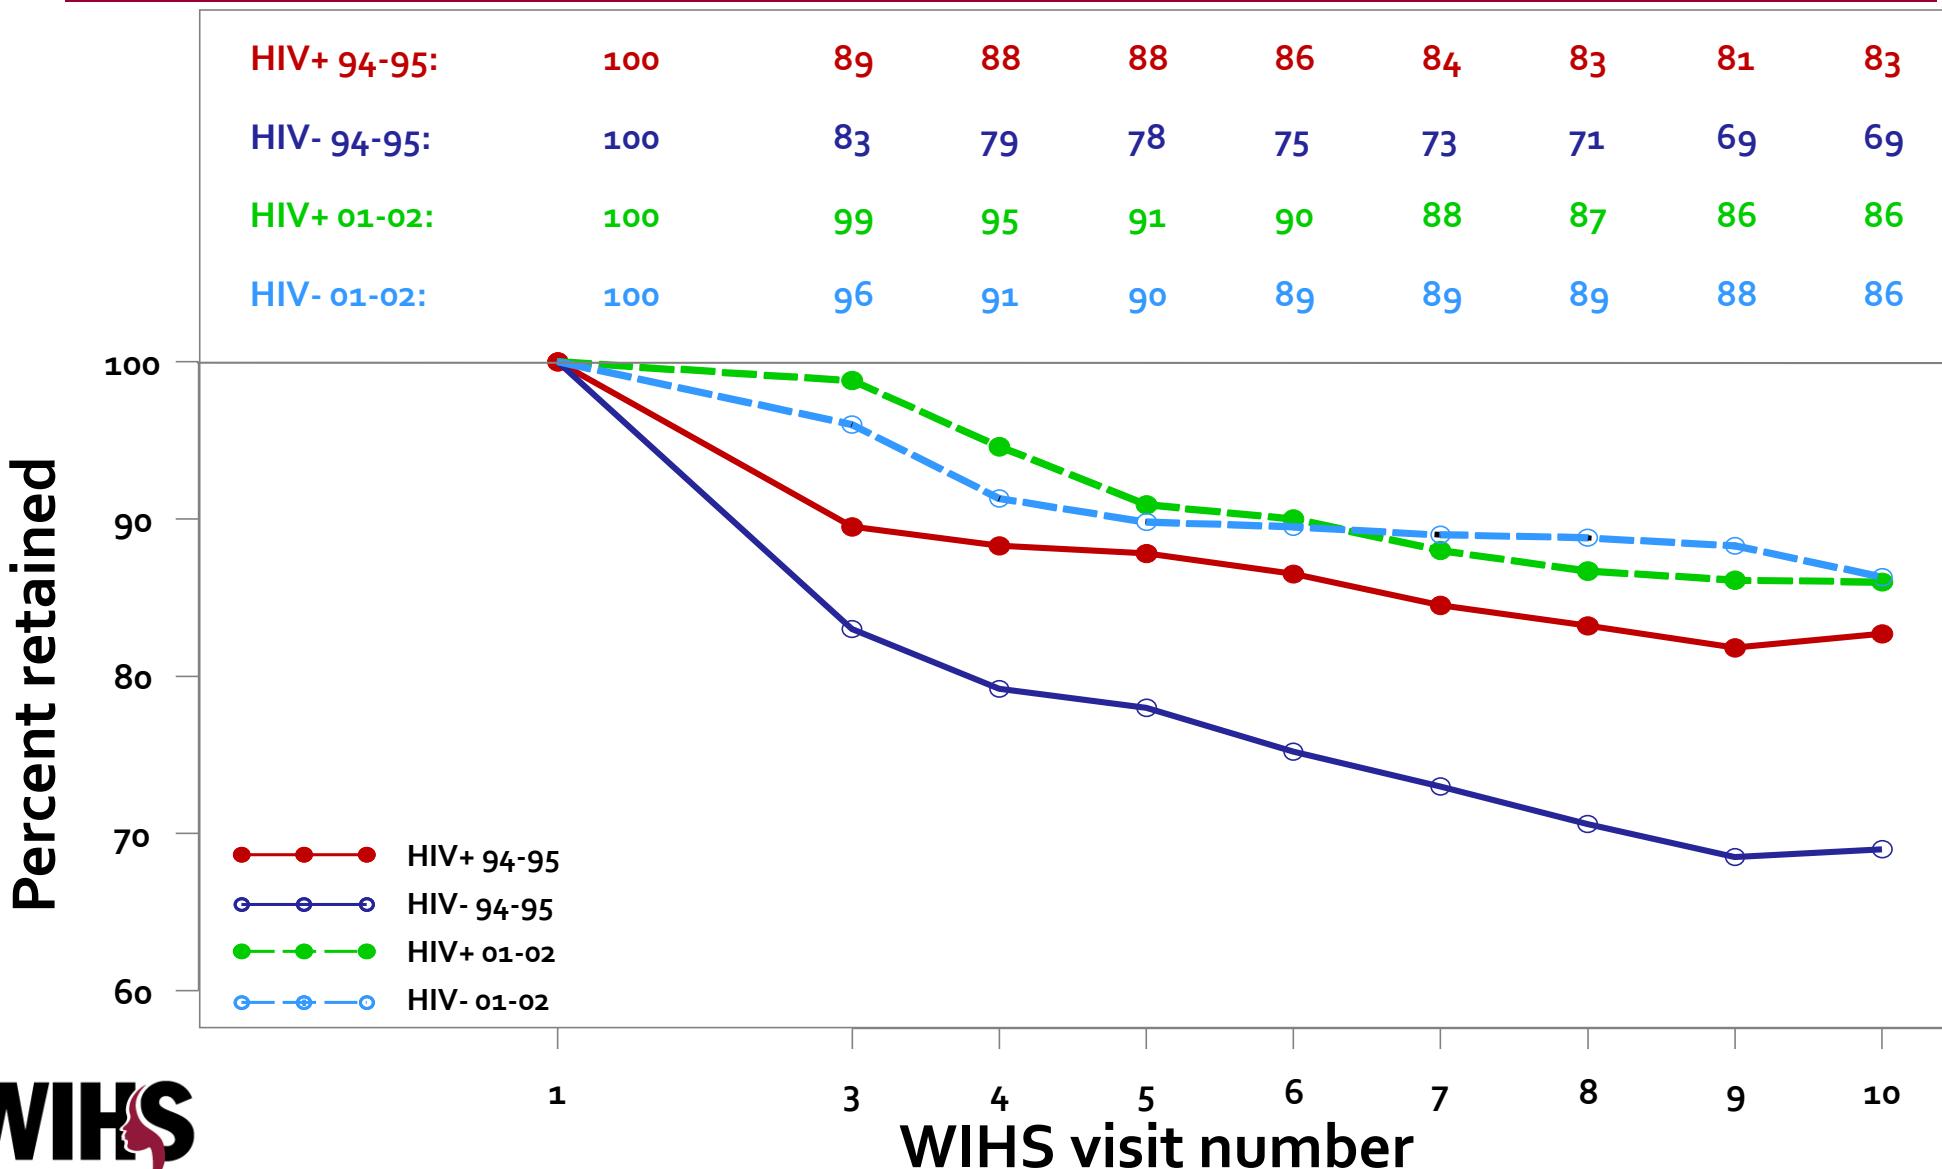

Retention Rates (v1-24) Stratified by HIV Status

(Hessol, Weber, . . . , Ameli, J Women's Health 2009; 18:1627-1637)

Retention Rates (v1-10) Stratified by HIV Status

(Hessol, Weber, . . . , Ameli, J Women's Health 2009; 18:1627-1637)

Does HIV Infection Promote Early Kidney Injury in Women?

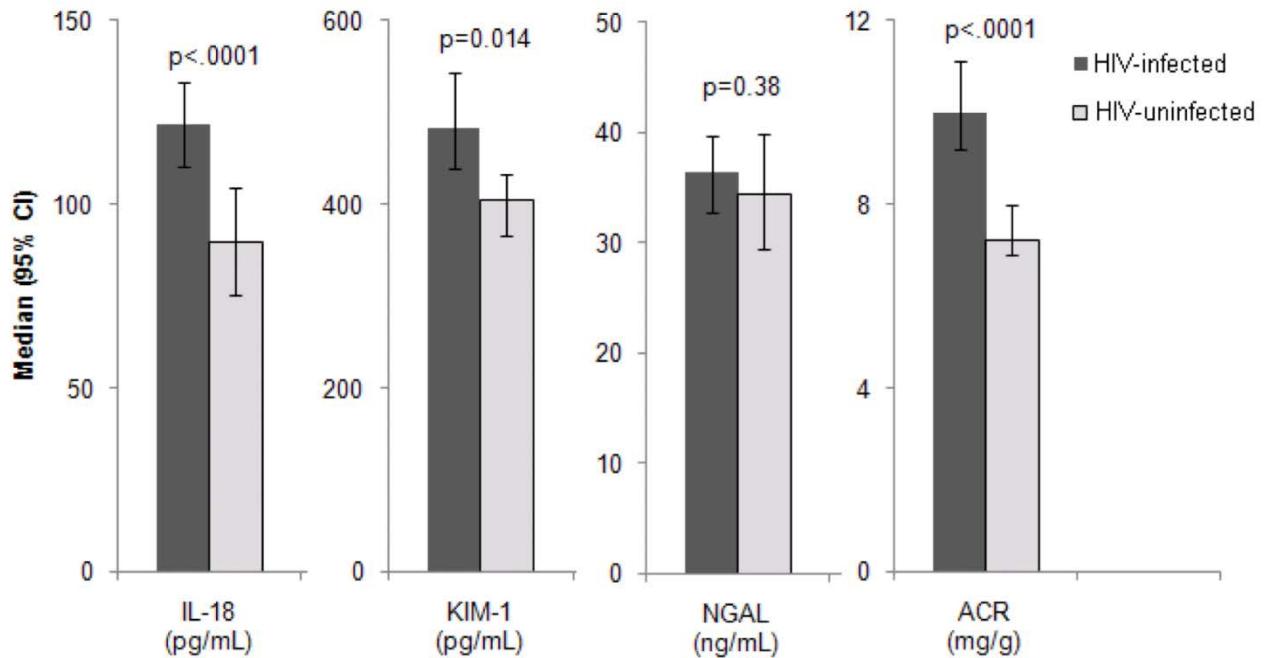

(Jotwani, Scherzer, . . . , Shlipak, *Antivir Ther* 2014;19(1):79-87)

Association of HIV infection with urine biomarkers among HIV-infected (N=908) and uninfected (N=289) WIHS participants

Note: Bars represent median urine biomarker concentrations with 95% confidence intervals.

P-values from Mann-Whitney U test.

Abbreviations: ACR, albumin-to-creatinine ratio; IL-18, interleukin-18; KIM-1, kidney injury molecule-1; NGAL, neutrophil gelatinase-associated lipocalin.

Echolucency of the Carotid Artery Intima-Media Complex and Intima-Media Thickness Have Different Cardiovascular Risk Factor Relationships

(Jung, Parrinello, . . . , Kaplan, J Am Heart Assoc 2015;4(2))

	N	Mean GSM* (95% CI)	P Value*
Nadir CD4+ T cell count, cells/mm³			
HIV+, ≥500	128	61.7 (58.5, 64.8)	Ref
HIV+, 350 to 500	194	62.2 (59.6, 64.7)	0.81
HIV+, 200 to 350	409	61.9 (60.2, 63.7)	0.89
HIV+, <200	551	62.3 (60.8, 63.8)	0.72
Current CD4+ T cell count, cells/mm³			
HIV+, ≥500	507	61.2 (59.7, 62.8)	Ref
HIV+, 350 to 500	278	61.2 (59.1, 63.4)	0.99
HIV+, 200 to 350	287	63.5 (61.5, 65.6)	0.08
HIV+, <200	194	63.1 (60.5, 65.6)	0.23

Age-adjusted correlation coefficient between nadir CD4+ T cells count with GSM=-0.03, P=0.28; age adjusted correlation coefficient between current CD4+ T cells count with GSM=-0.08, P=0.005. GSM indicates grey scale median; WIHS, Women's Interagency HIV Study.

*Age-adjusted

Echolucency of the Carotid Artery Intima-Media Complex and Intima-Media Thickness Have Different Cardiovascular Risk Factor Relationships

(Jung, Parrinello, . . . , Kaplan, J Am Heart Assoc 2015;4(2))

	N	Mean cIMT* (95% CI)	P Value*
Nadir CD4+ T cell count, cells/mm³			
HIV+, ≥500	128	737.5 (720.1, 754.9)	Ref
HIV+, 350 to 500	194	722.4 (708.3, 736.5)	0.18
HIV+, 200 to 350	409	735.1 (725.4, 744.7)	0.81
HIV+, <200	551	717.1 (708.7, 725.5)	0.04
Current CD4+ T cell count, cells/mm³			
HIV+, ≥500	507	732.6 (723.9, 741.3)	Ref
HIV+, 350 to 500	278	723.5 (711.7, 735.3)	0.22
HIV+, 200 to 350	287	719.3 (707.6, 730.9)	0.07
HIV+, <200	194	721.1 (707.0, 735.3)	0.18

Age-adjusted correlation coefficient between nadir CD4+ T cells count with cIMT=-0.06, P=0.04; age adjusted correlation coefficient between current CD4+ T cells count with cIMT=-0.07, P=0.01. cIMT indicates carotid artery intima-media thickness; WIHS, Women's Interagency HIV Study.

*Age-adjusted

Incidence of Diabetes

(Justman, Benning, . . . , Anastos, *J Acquir Immune Defic Syndr* 2003; 32:298-302)

Therapy Group	N	Incidence (cases/100PY)	Incidence (stratified by initial BMI) ^a			
			Morbidly Obese	Obese	Overweight	Normal
PI	609	2.8 ^b	3.1	4.8	3.2	1.6
RTI	932	1.2	1.5	2.4	2.0	0.3
No ART	816	1.2	6.9	1.0	1.1	0.8
HIV-	350	1.4	4.8	2.2	0.5	1.1

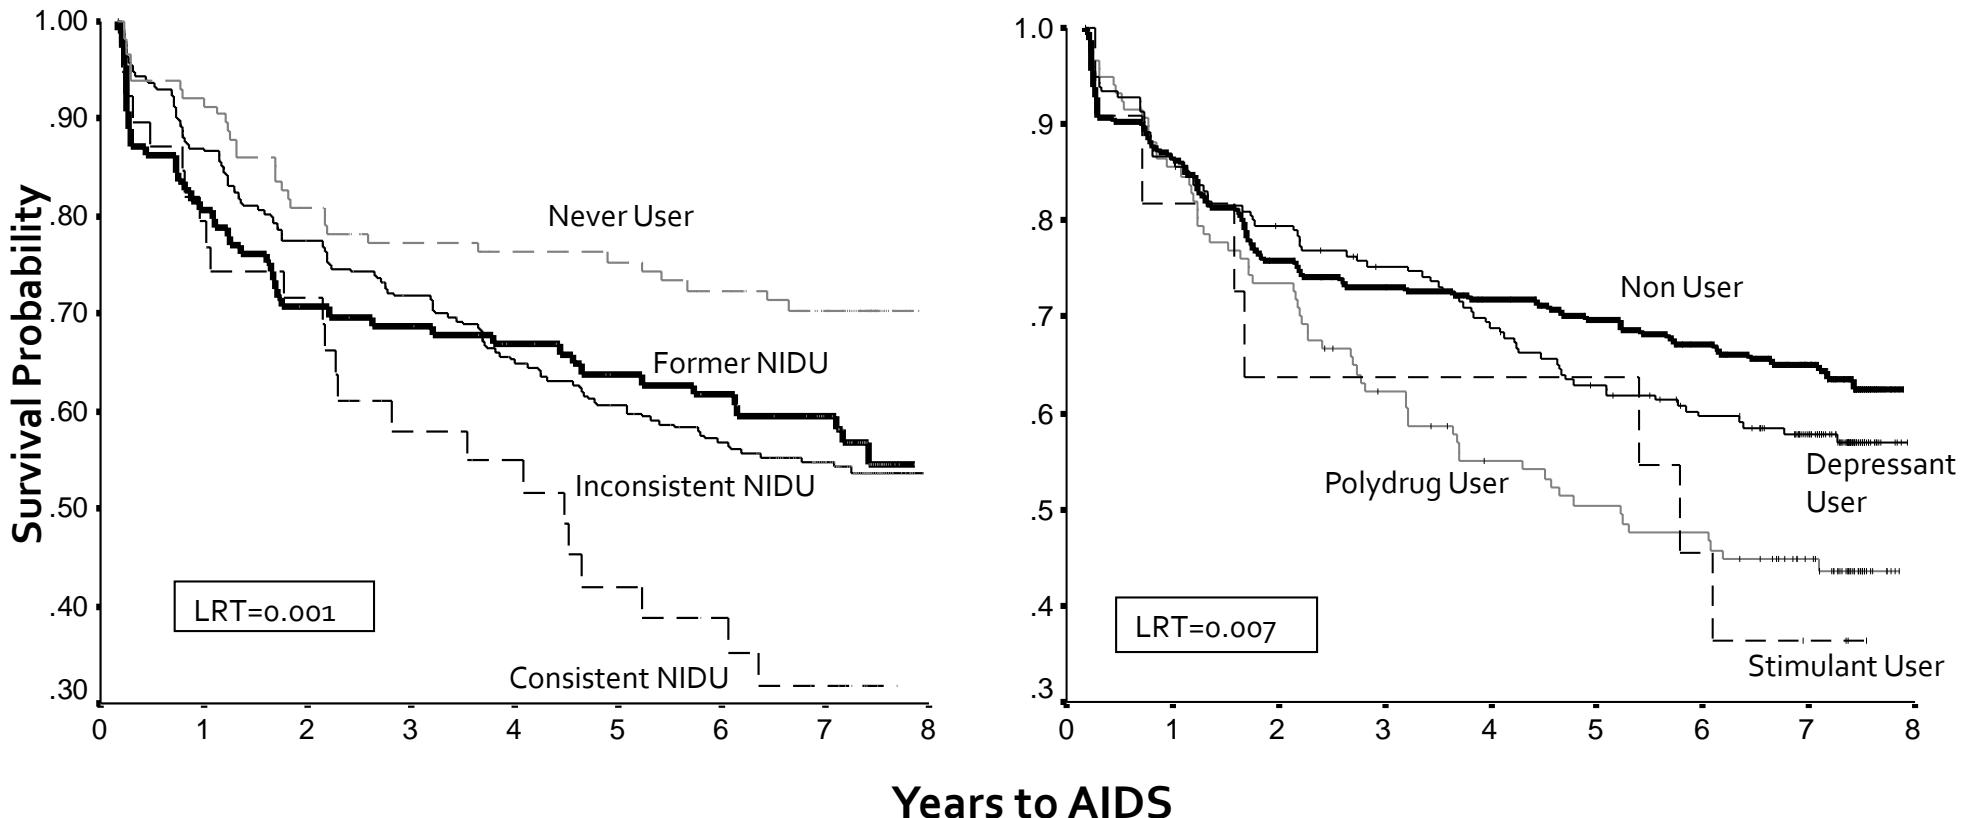

^a Adjusted for BMI, the relative risk of reporting DM for PI users vs. HIV- women is 2.0 [$P = 0.06$]; vs. RTI users, 2.2 [$P = 0.02$].

Adjusted for therapy group, the relative risk of reporting DM for morbidly obese, obese and overweight vs. normal/underweight women is 5.2 [$P = < 0.0001$], 2.8 [$P = 0.0002$], 2.0 [$P = 0.04$], respectively.

^b $P = 0.06$ [RR = 1.97] for comparison with HIV- women; $P = 0.01$ [RR = 2.34] for comparison with RTI group.

Time to AIDS Among Non-injecting Drug Users (NIDU) in the HAART Era

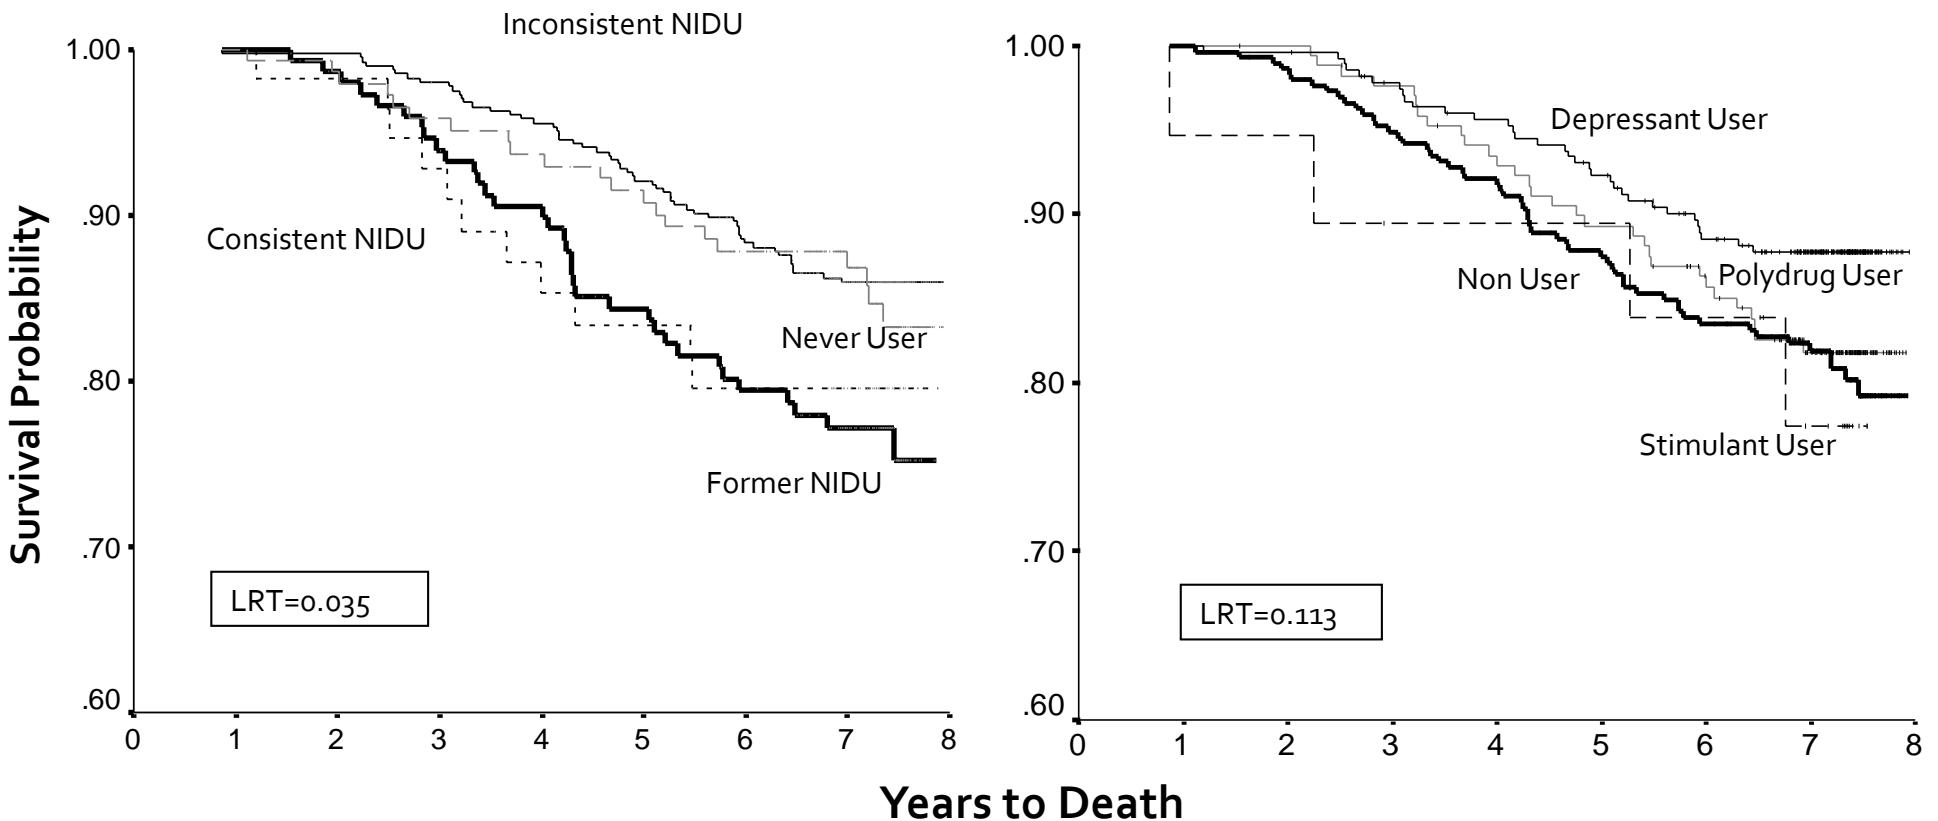

(Kapadia, Cook, . . . , Vlahov, *Addiction* 2005; 100:990-1002)

Kaplan-Meier curves of cumulative probabilities of survival for AIDS by pattern and type of NIDU among HAART users, WIHS (n=1046).

Time to Death Among Non-injecting Drug Users (NIDU) in the HAART Era

(Kapadia, Cook, . . . , Vlahov, *Addiction* 2005; 100:990-1002)

Kaplan-Meier curves of cumulative probabilities of survival for death by pattern and type of NIDU among HAART users, WIHS (n=1046).

Association between Sociodemographics and ART/HAART Adherence

(Kapadia, Vlahov, . . . , Wilson, *Am J Drug Alcohol Abuse* 2008; 34:161-170)

Moderate-to-high Risk of CHD among Men & Women >40 Years of Age

(Kaplan, Kingsley, . . . , Gange, *Clin Infect Dis* 2007; 45:1074-1081)

Variable	Adjusted OR (95% CI)
HAART	
Current PI-based	1 (reference)
Current non-PI-based	0.74 (0.53 – 1.01)
Former	0.68 (0.46 – 1.03)
Naïve	0.57 (0.36 – 0.89)
Annual Income	
< \$10,000	2.32 (1.51 – 3.56)
\$10,000 - \$39,999	1.42 (0.97 – 2.10)
≥ \$40,000	1 (reference)
Body Mass Index	
< 18.5 (underweight)	0.80 (0.37 – 1.74)
18.5 – 24.9 (normal weight)	1 (reference)
25 – 30 (overweight)	1.41 (1.03 – 1.93)
> 30 (obese)	1.79 (1.25 – 2.56)

The outcome was defined as moderate-to-high predicted risk of coronary heart disease, defined as 10-year risk of ≥15% or diabetes. ORs are adjusted for values in table, plus age, center, cohort entry period, AIDS, education, IDU, alcohol use, race/ethnicity and sex.

Relationship between Standard Cardiovascular Risk Factors and CIMT

(Kaplan, Kingsley, . . . , Hodis, *AIDS* 2008; 22:1615-1624)

Cervical Precancer Risk in HIV-Infected Women Who Test Positive for Oncogenic HPV Despite a Normal Pap Test

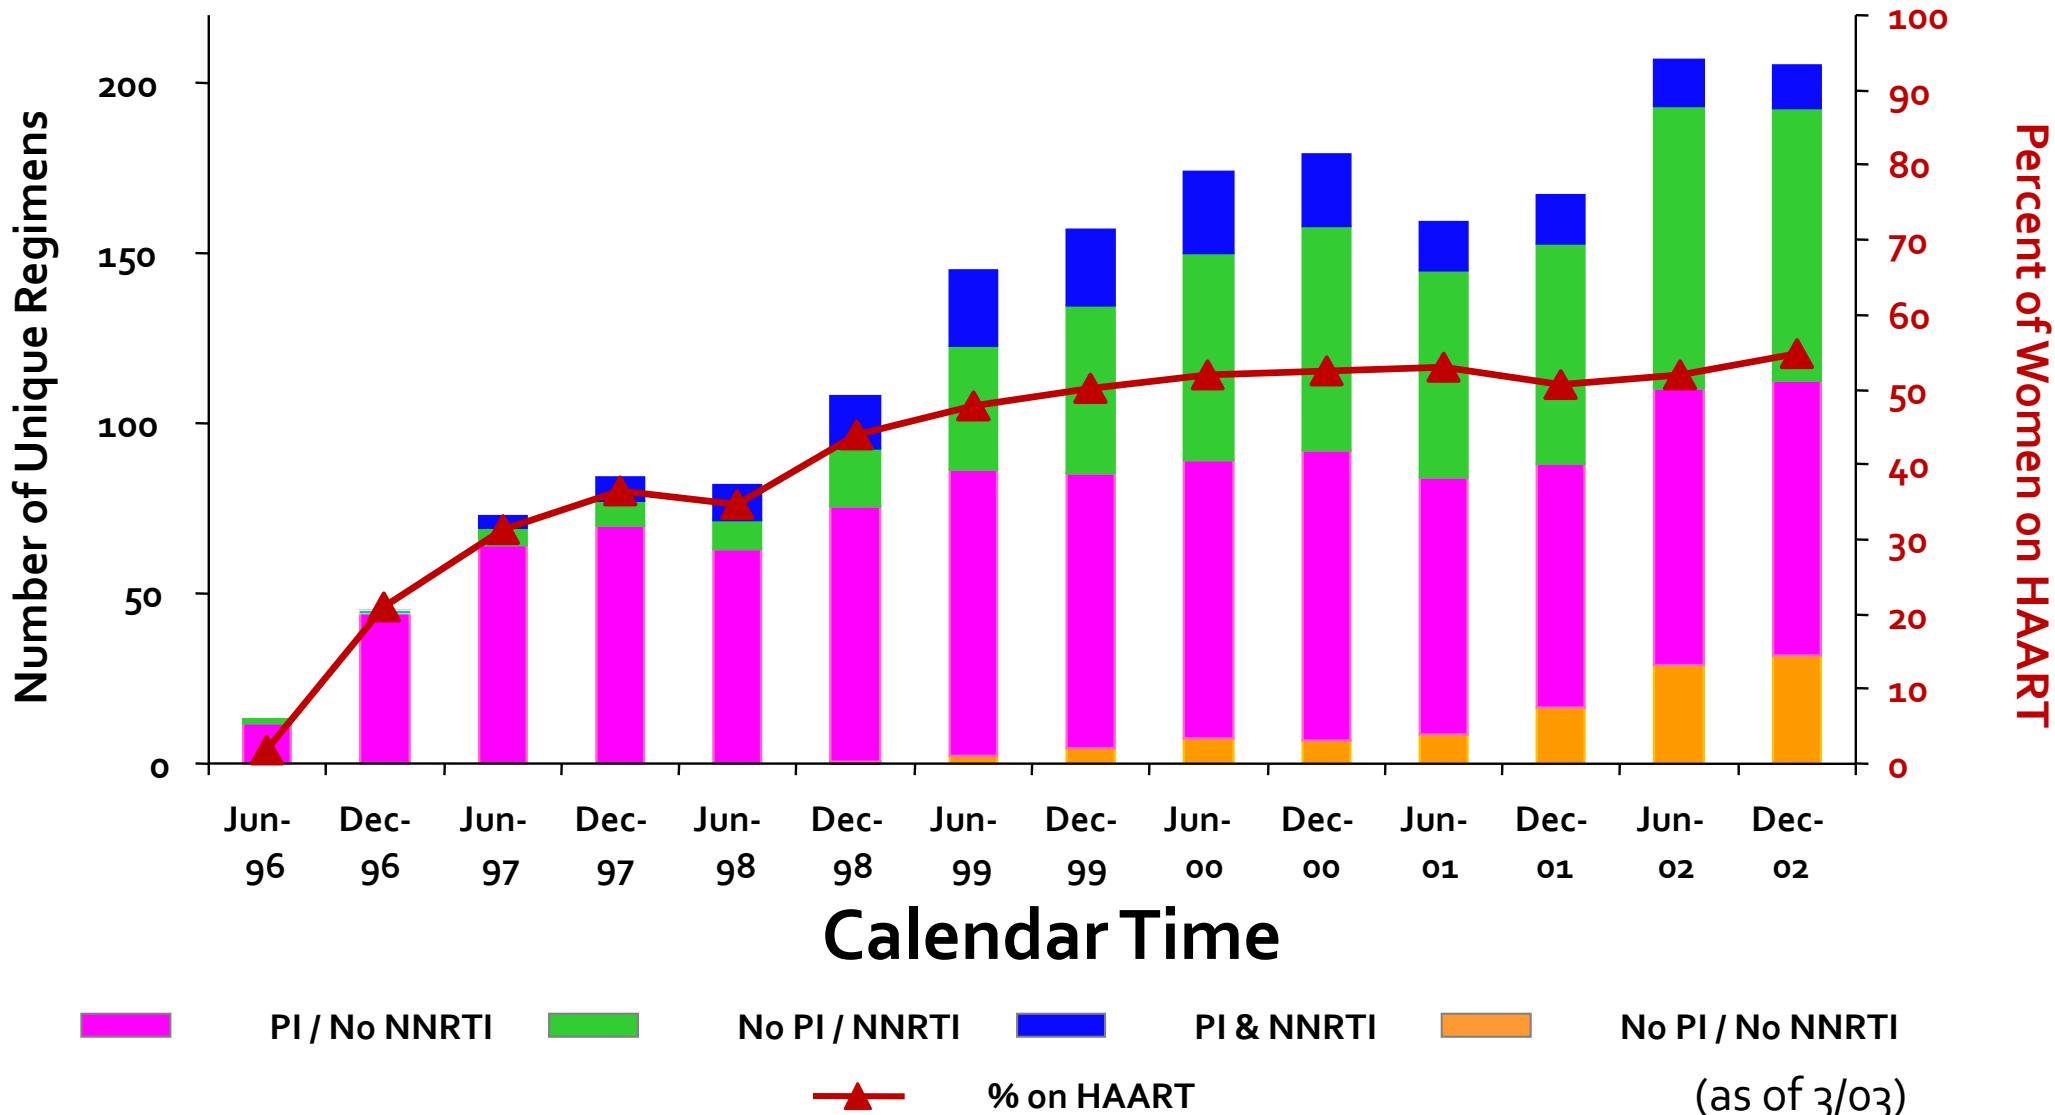

(Keller, Burk, . . . , Strickler, *Clin Infect Dis* 2015;61(10):1573-1581)

Cumulative risk of CIN-2+ (a) and CIN-3+ (b) among HIV-infected women who at baseline had a normal Pap result with no oncogenic HPV (blue diamonds), any oncogenic HPV (red squares), HPV type 16 (green triangles), or had a baseline Pap diagnosed as LSIL (purple crosses). The cumulative risk for women with LSIL includes both prevalent and incident cases, as LSIL is an indication for immediate colposcopy, whereas for all other groups the data reflect cumulative incidence.

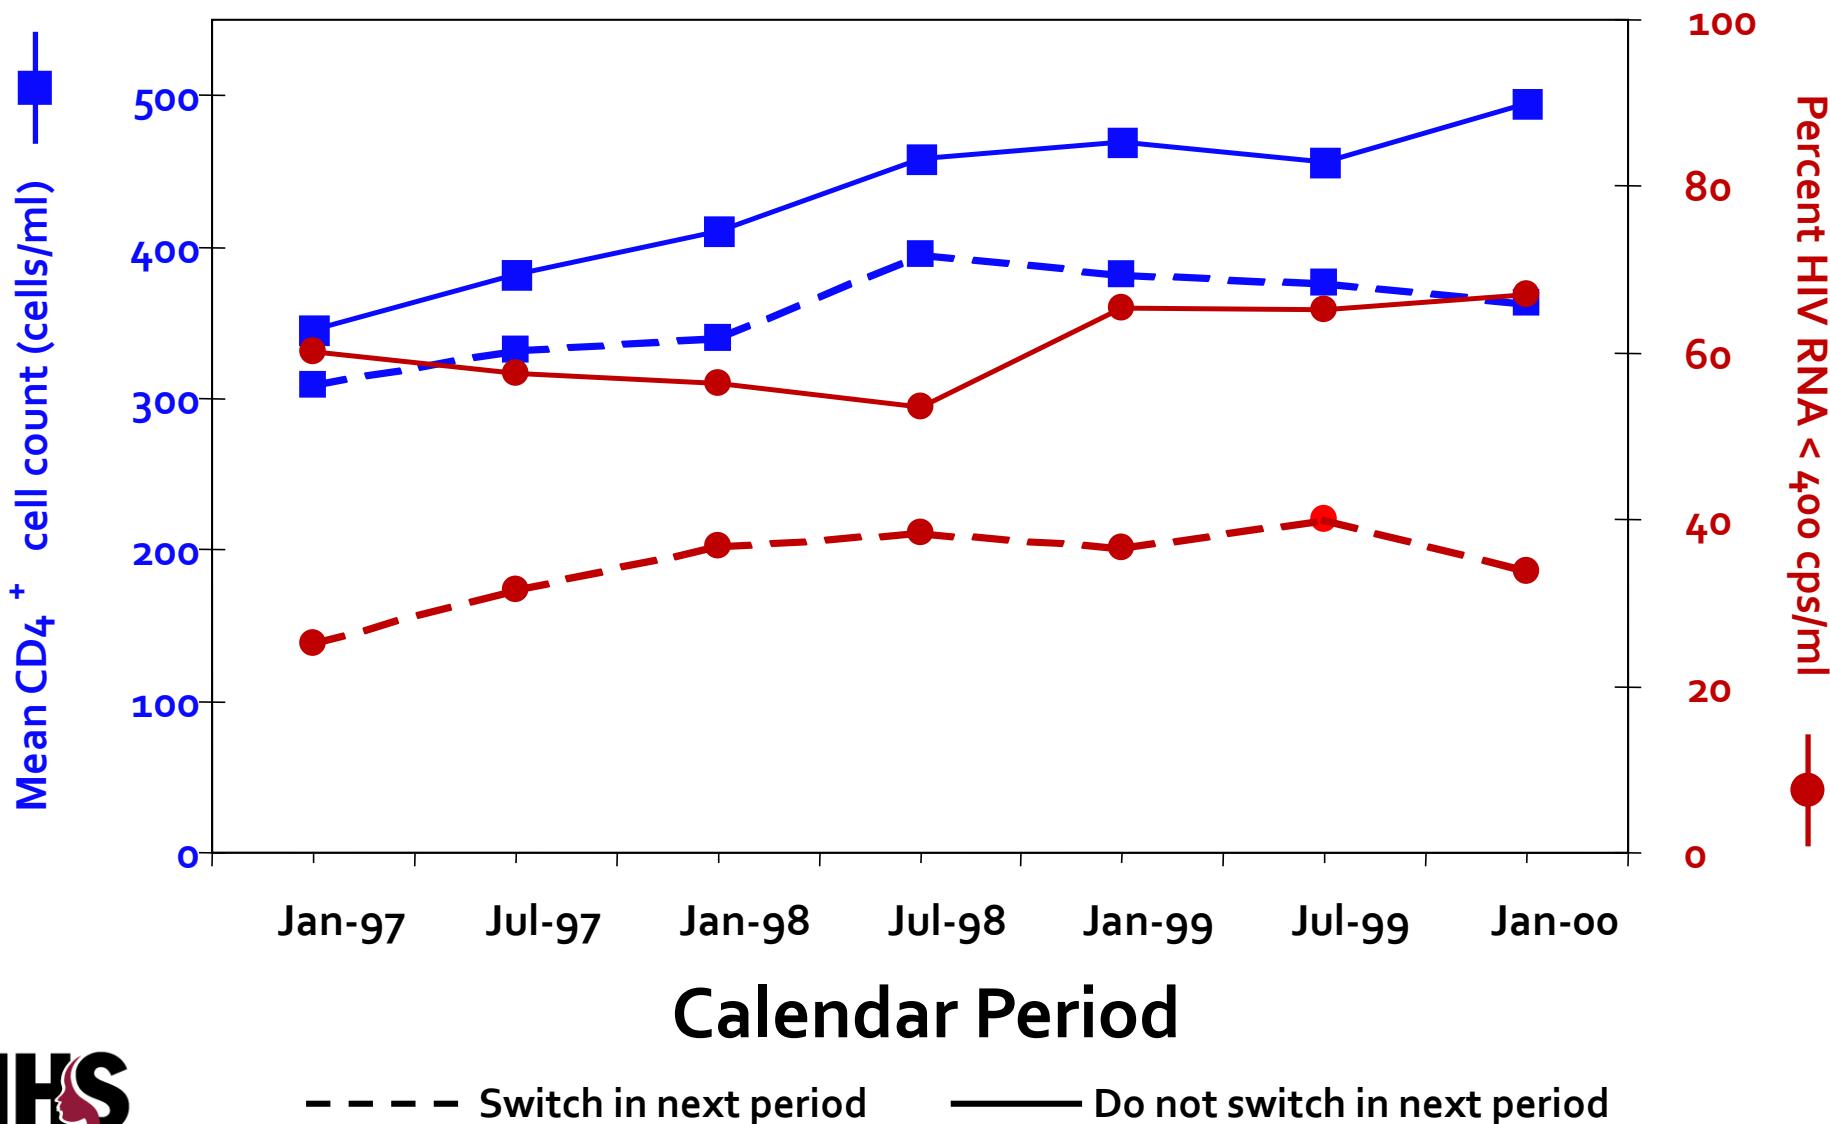

Unique HAART Regimens by Calendar Time

(Kirstein, Greenblatt, . . . , Gange, *J Acquir Immune Defic Syndr* 2002; 29:495-503)

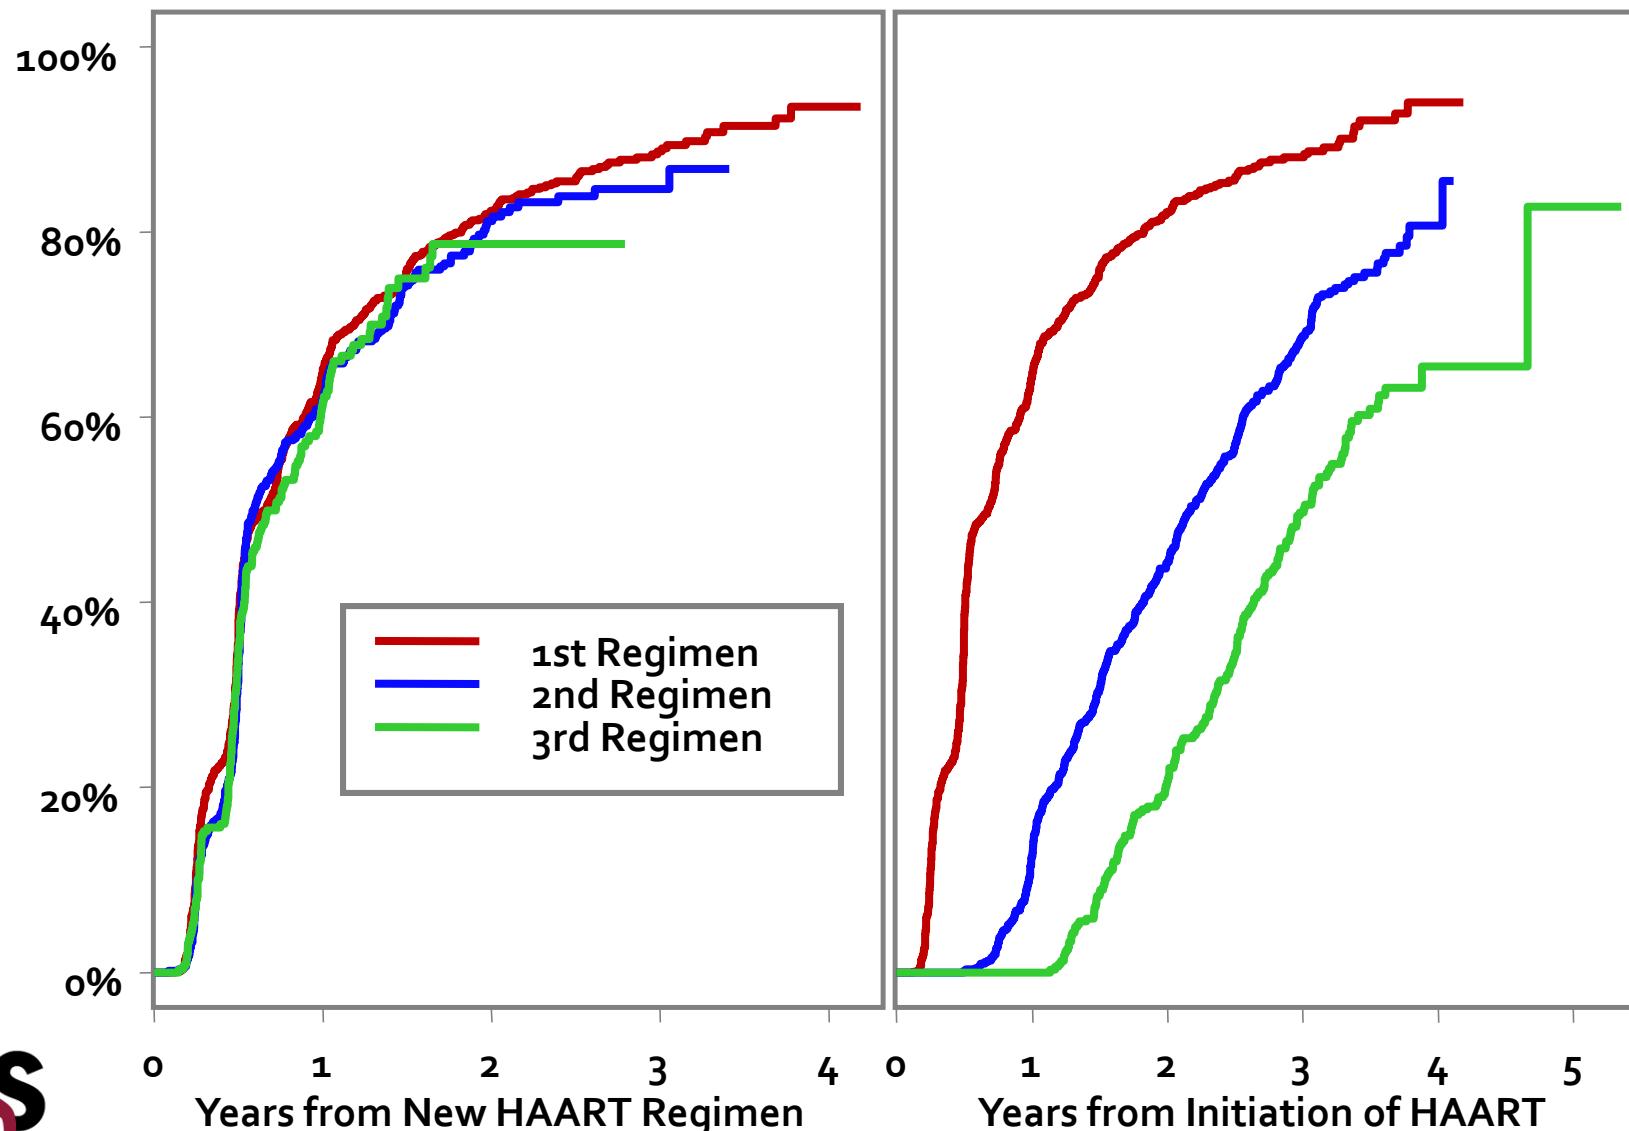

Selection by Indication for HAART Switching

(Kirstein, Greenblatt, . . . , Gange, J Acquir Immune Defic Syndr 2002; 29:495-503)

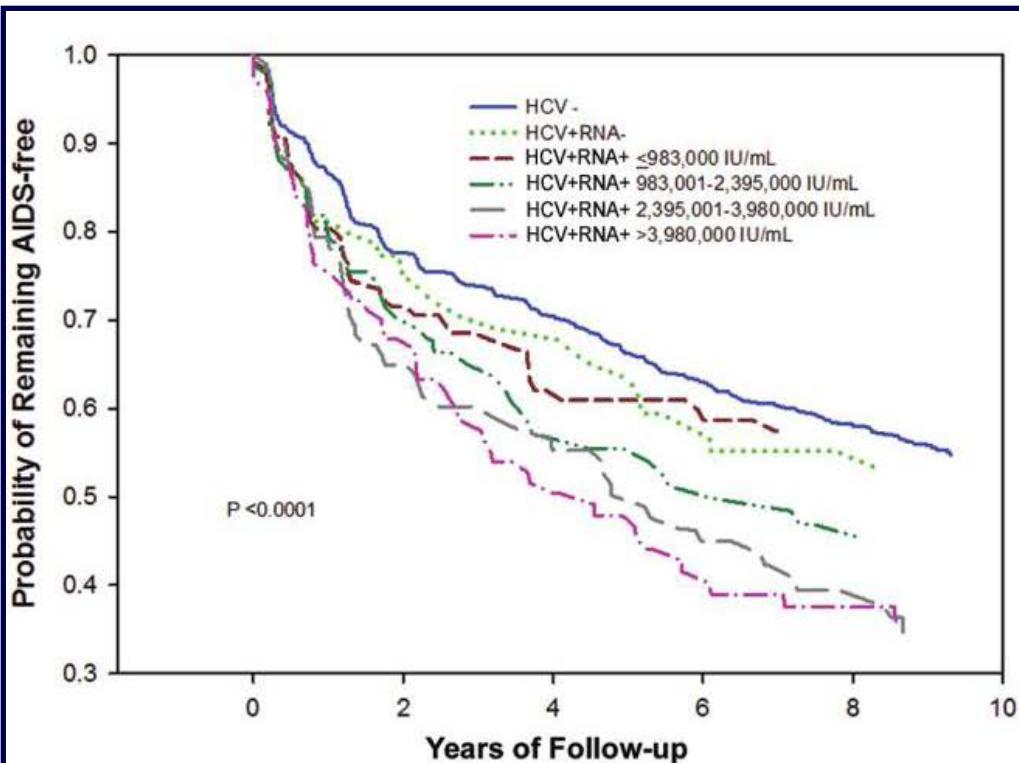

Time to Switching HAART

(Kirstein, Greenblatt, . . . , Gange, *J Acquir Immune Defic Syndr* 2002; 29:495-503)

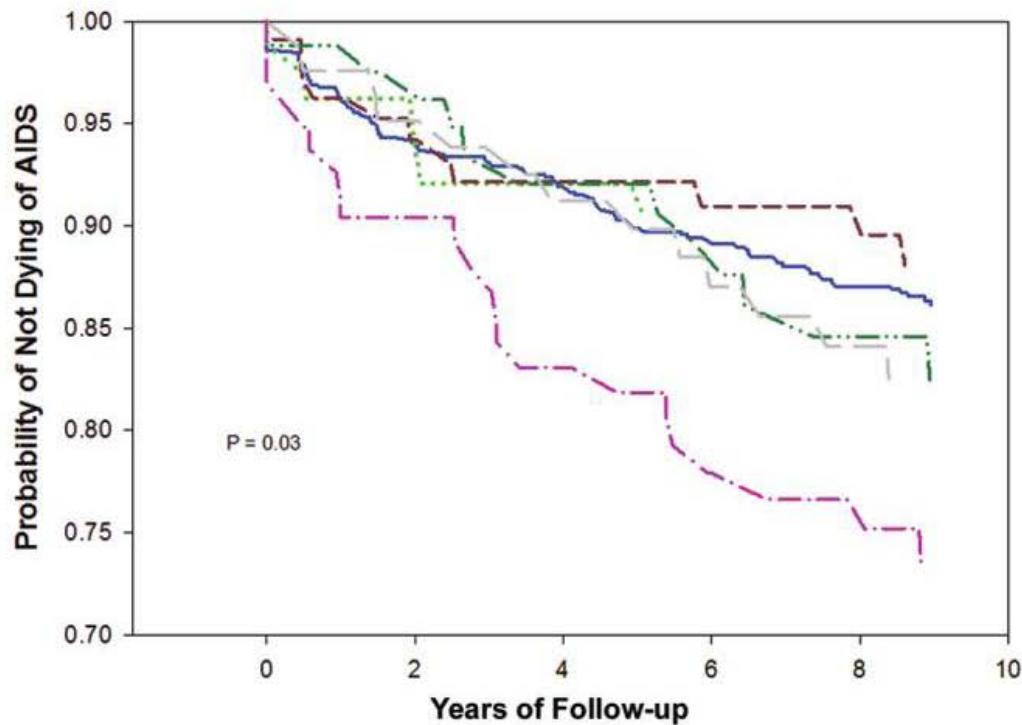

Probability of Remaining AIDS-free and of not Dying of AIDS by HCV Status at Baseline

(Kovacs, Karim, . . . , Al-Harthi, *JID* 2010; 201:823-834)

Probability of remaining AIDS-free
by HCV status for 1307 HIV+ women

Probability of not dying of AIDS
by HCV status for 1307 HIV+ women

Relation of HLA Class I and II Supertypes with Spontaneous Clearance of Hepatitis C Virus

(Kuniholm, Anastos, . . . , Strickler, *Genes Immun* 2013;14(5):330- 335)

Independent Associations of HLA Supertypes and HLA Alleles with HCV Viremia among HCV-seropositive Women ^{a,b}

	PR (95% CI)	P-value
<i>HLA supertype</i>		
DRB3	0.44 (0.25, 0.76)	0.004
DR8	1.76 (1.14, 2.72)	0.01
DR1*01	1.50 (0.90, 2.50)	0.12
A	1.49 (0.97, 2.28)	0.07
<i>Individual alleles</i>		
DRB1*07:01	1.73 (1.18, 2.53)	0.005
B*57:01	1.44 (0.70, 3.00)	0.32
B*57:03	1.89 (1.18, 3.02)	0.008
C*01:02	1.32 (0.72, 2.43)	0.37

Abbreviations: CI, confidence interval; HVA, hepatitis C virus; HLA, human leukocyte antigen; PR, prevalence ratio. ^aThose HLA supertypes that retained significant or marginally significant ($\alpha < 0.10$) false discovery rate (FDR)-adjusted *q* values after adjustment for multiple comparisons, and those alleles not part of these supertypes that were significantly associated with HCV viremia in our prior study in this population are shown. ^bResults from a single multivariable log-binomial model with adjustment for race/ethnicity (non-Hispanic black, non-Hispanic white and Hispanic).

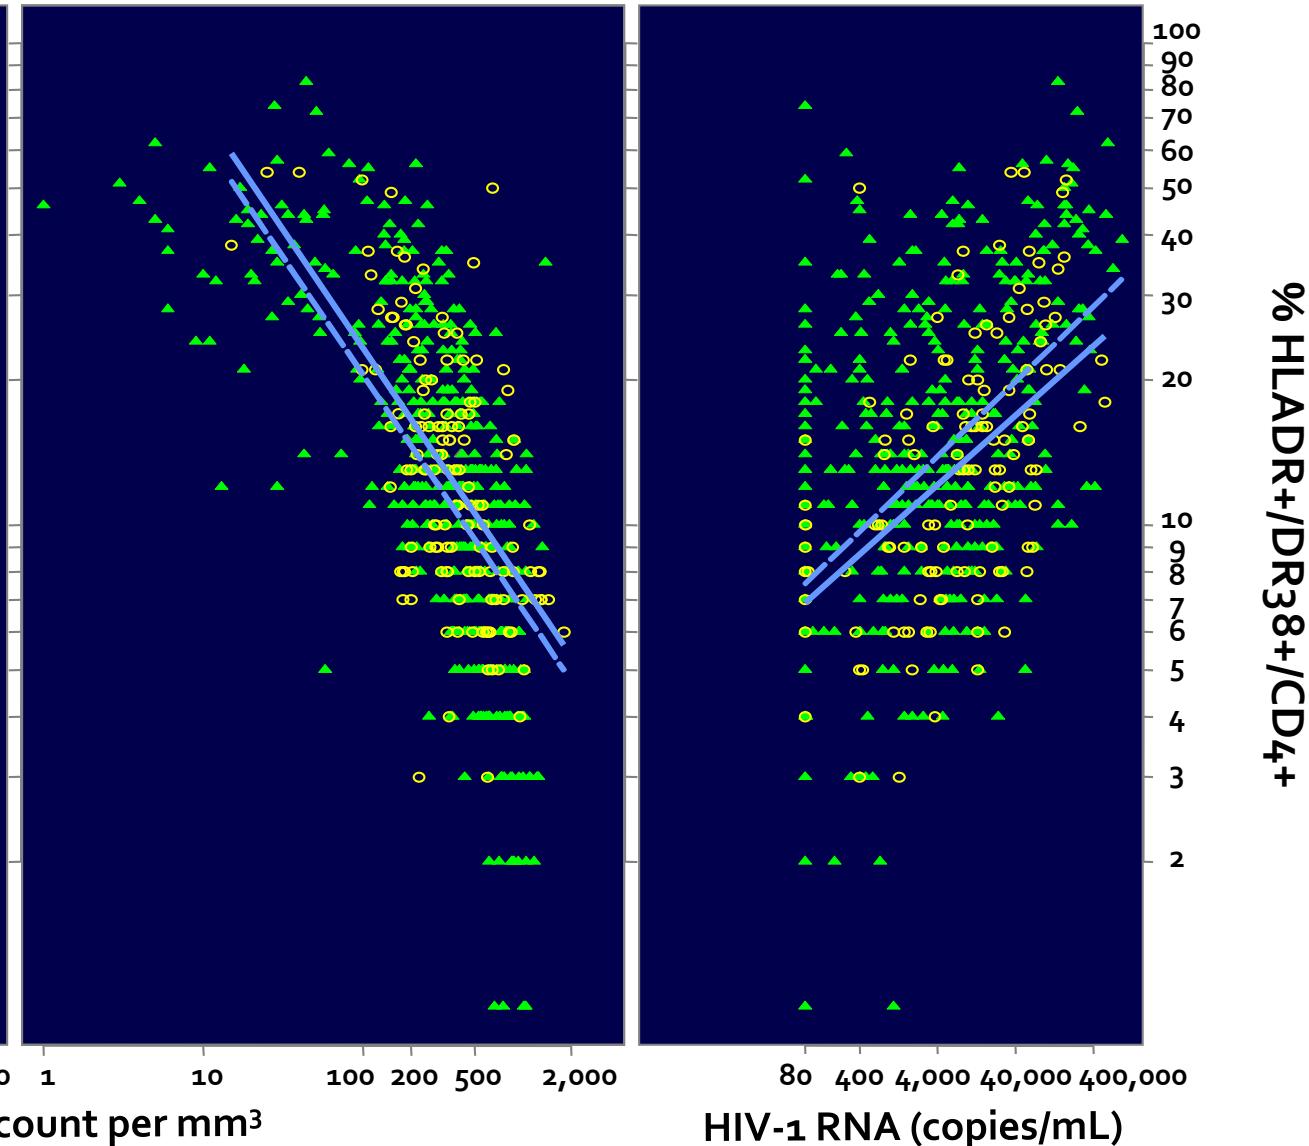

Impact of Drug Use on CD4 Cell Activation

(Landay, Benning, . . . , Kovacs, *JID* 2003; 188:209-218)

HIV-negative

HIV-positive

Effect of IDU History on HAART Initiation and Incident AIDS or Death

(Lau, Cole, Gange, *Am J Epidemiol* 2009; 170:244-256)

	Time to HAART Initiation Prior to AIDS/Death		Time to AIDS or Death Prior to HAART Initiation	
	Semi-Parametric Proportional Hazards Model ^a	Parametric Mixture Model ^b	Semi-Parametric Proportional Hazards Model ^a	Parametric Mixture Model ^b
History of IDU Cause-specific Relative Hazard (95% CI)	0.67 (0.57-0.80)	0.71 (0.59-0.85)	1.71 (1.37-2.13)	1.77 (1.40-2.27)
History of IDU Subdistribution Relative Hazard (95% CI)	0.60 (0.50-0.71)	0.60 (0.50-0.71)	2.01 (1.62-2.51)	2.02 (1.62-2.59)

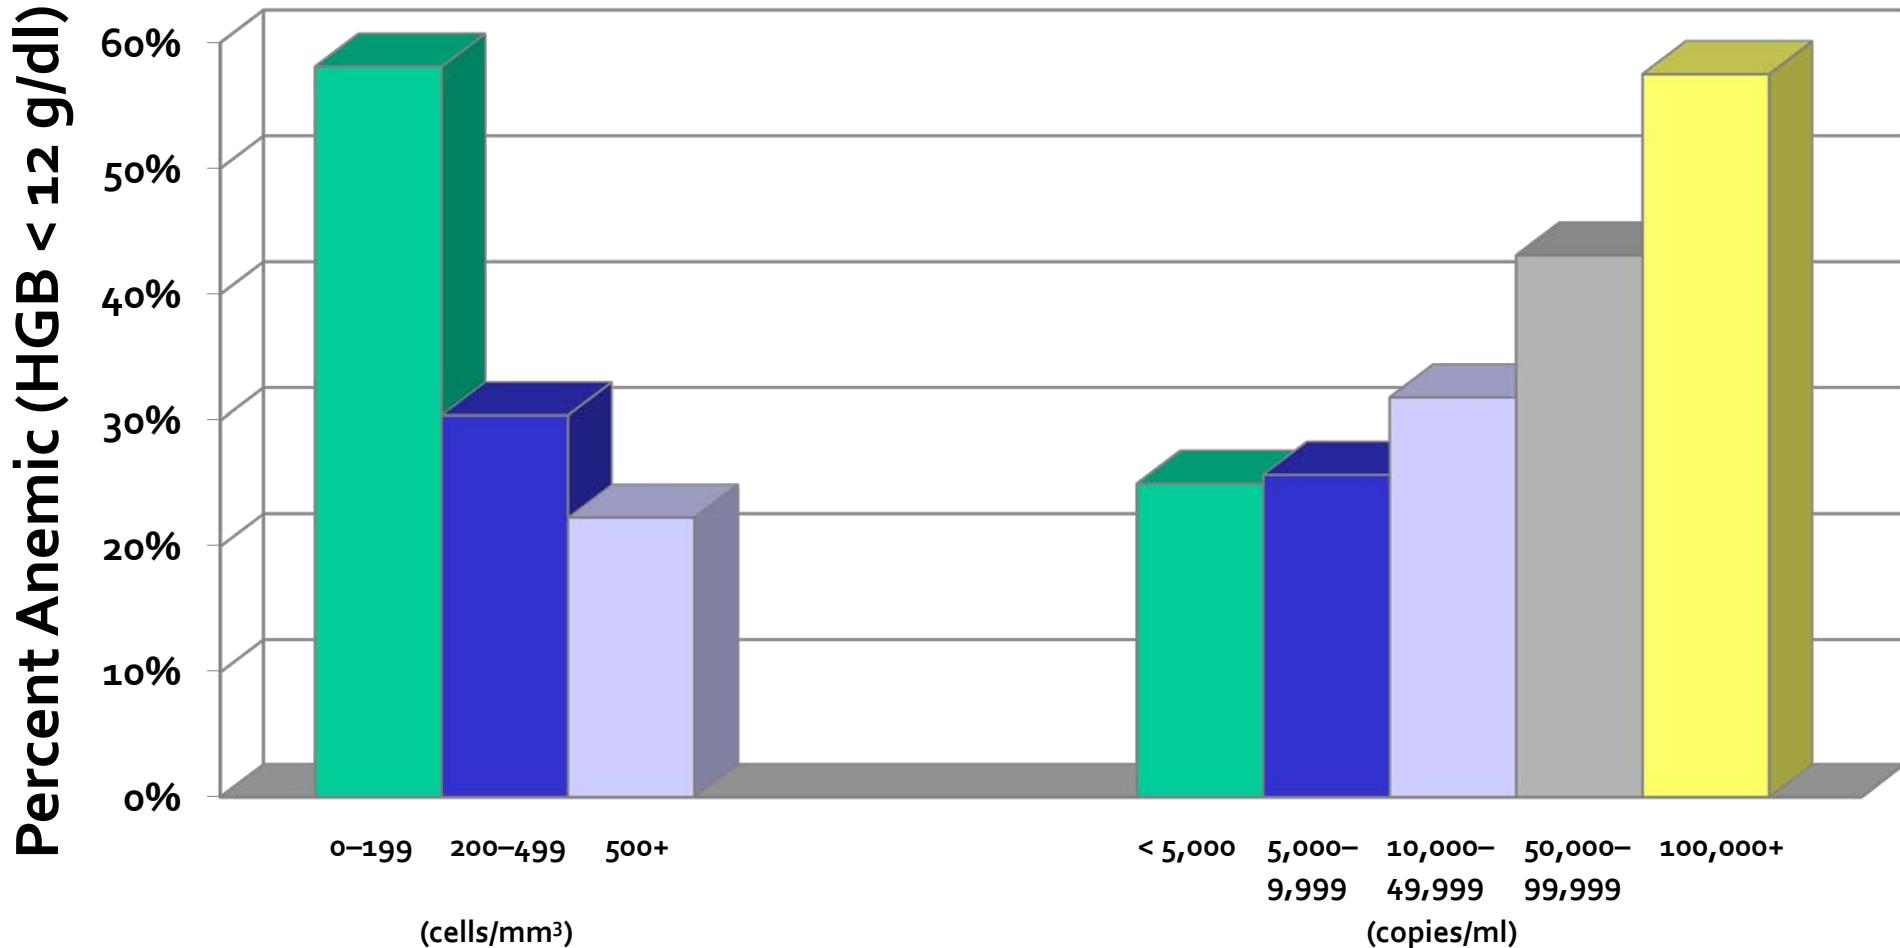

Models adjusted for age, race and CD4 nadir at study entry.

^a Some indication that proportional hazards assumption may not hold – these differences were quantitative than qualitative.

^b A lognormal (for HAART) and generalized gamma (for AIDS/Death) distributions were used for the parametric mixture model.

Prevalence of Anemia in HIV+ WIHS Women

Abbreviations: CI = confidence interval, HVLT = Hopkins Verbal Learning Test; WIHS = Women's Interagency HIV Study

^aAnalyses conducted on demographically corrected t scores, where t scores were calculated based on age, years of education, Wide Range Achievement Test standard score, and race/ethnicity. The regression then adjusted for all of the following factors: site, cohort, income, smoking status, self-reported rates of depressive symptoms and antidepressant medication, hepatitis C virus antibody status, and alcohol, marijuana, crack, cocaine, and/or heroin use. For the HVLT, Trail Making Test, Symbol Digit, and Stroop we also controlled for the number of times a woman was exposed to the test during WIHS participation. B = parameter estimate reflecting the difference between HIV-infected and HIV-uninfected women.

^bLog-transformed scores were used.

(Massad, Xie,...Strickler, Am J Obstet Gynecol 2015; 212(5):606)

Understanding the Disparity: Predictors of Virologic Failure in Women Using HAART Vary by Race and/or Ethnicity

(McFall, Dowdy, . . . , Althoff, *J Acquir Immune Defic Syndr* 2013;64(3):289-298)

Annual proportion (and 95% confidence intervals) of women with virologic failure, by race/ethnicity, the Women's Interagency HIV Study (WIHS), 2007-2010

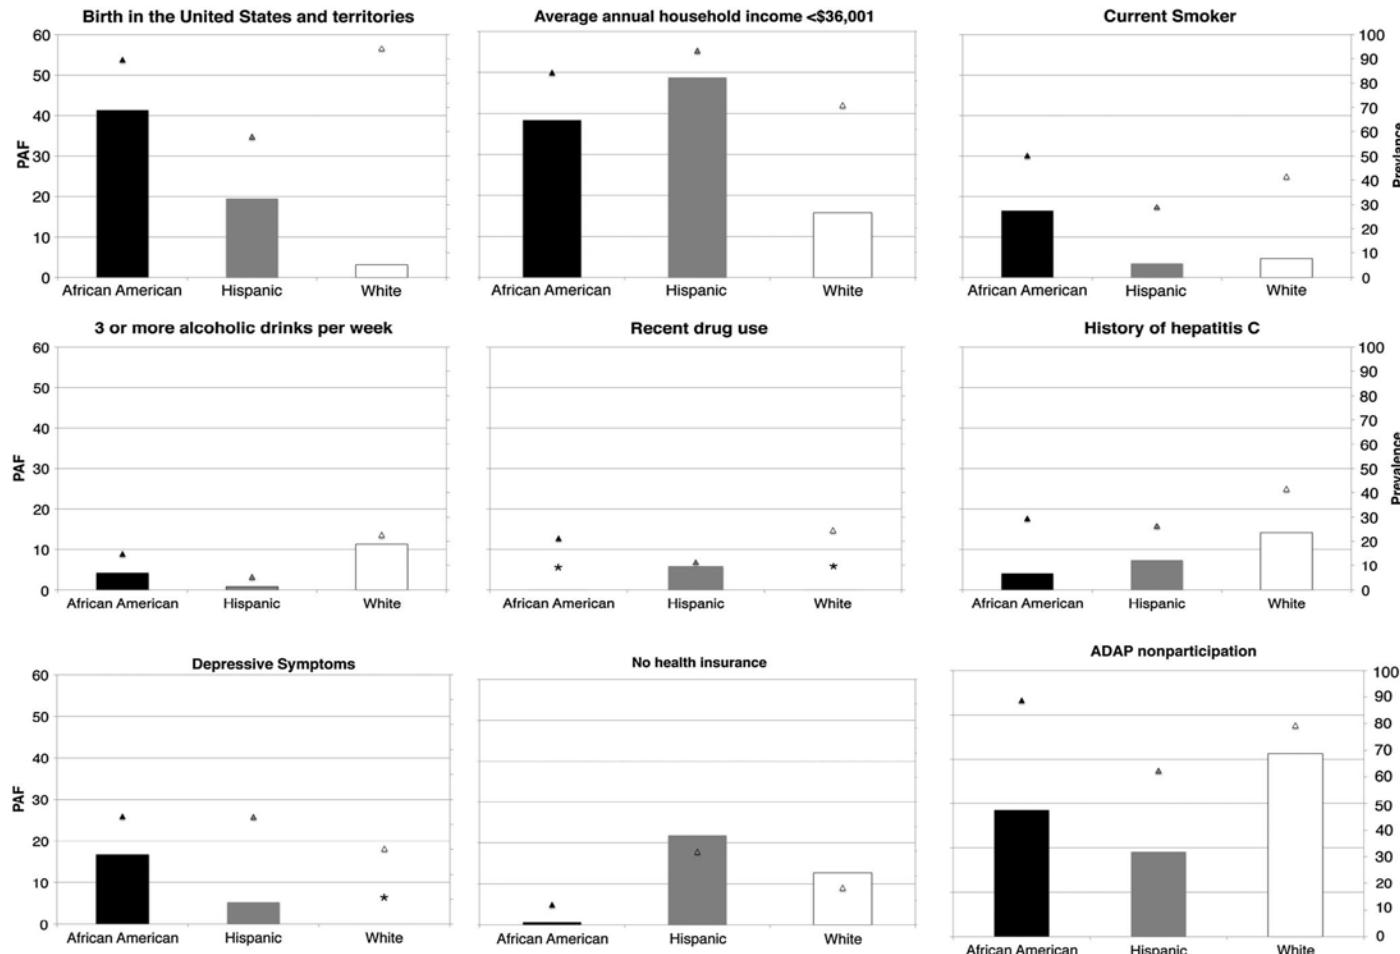

Number at risk (N)

All women	708	761	767	785
African-American	379	405	412	423
Hispanic	214	231	236	240
White/other	115	125	119	122

P-value for trends: All women, $p=0.483$; African-American women, $p=1$; Hispanic women, $p=0.889$; White $p=0.363$.

Understanding the Disparity: Predictors of Virologic Failure in Women Using HAART Vary by Race and/or Ethnicity

(McFall, Dowdy, . . . , Althoff, *J Acquir Immune Defic Syndr* 2013;64(3):289-298)

PAFs (Population-attributable fractions) and prevalence of predictors stratified by race/ethnicity, WIHS, April 2006 to March 2011 (n = 792). Bars represent PAF; Triangles represent prevalence; *Negative population attributable fraction.

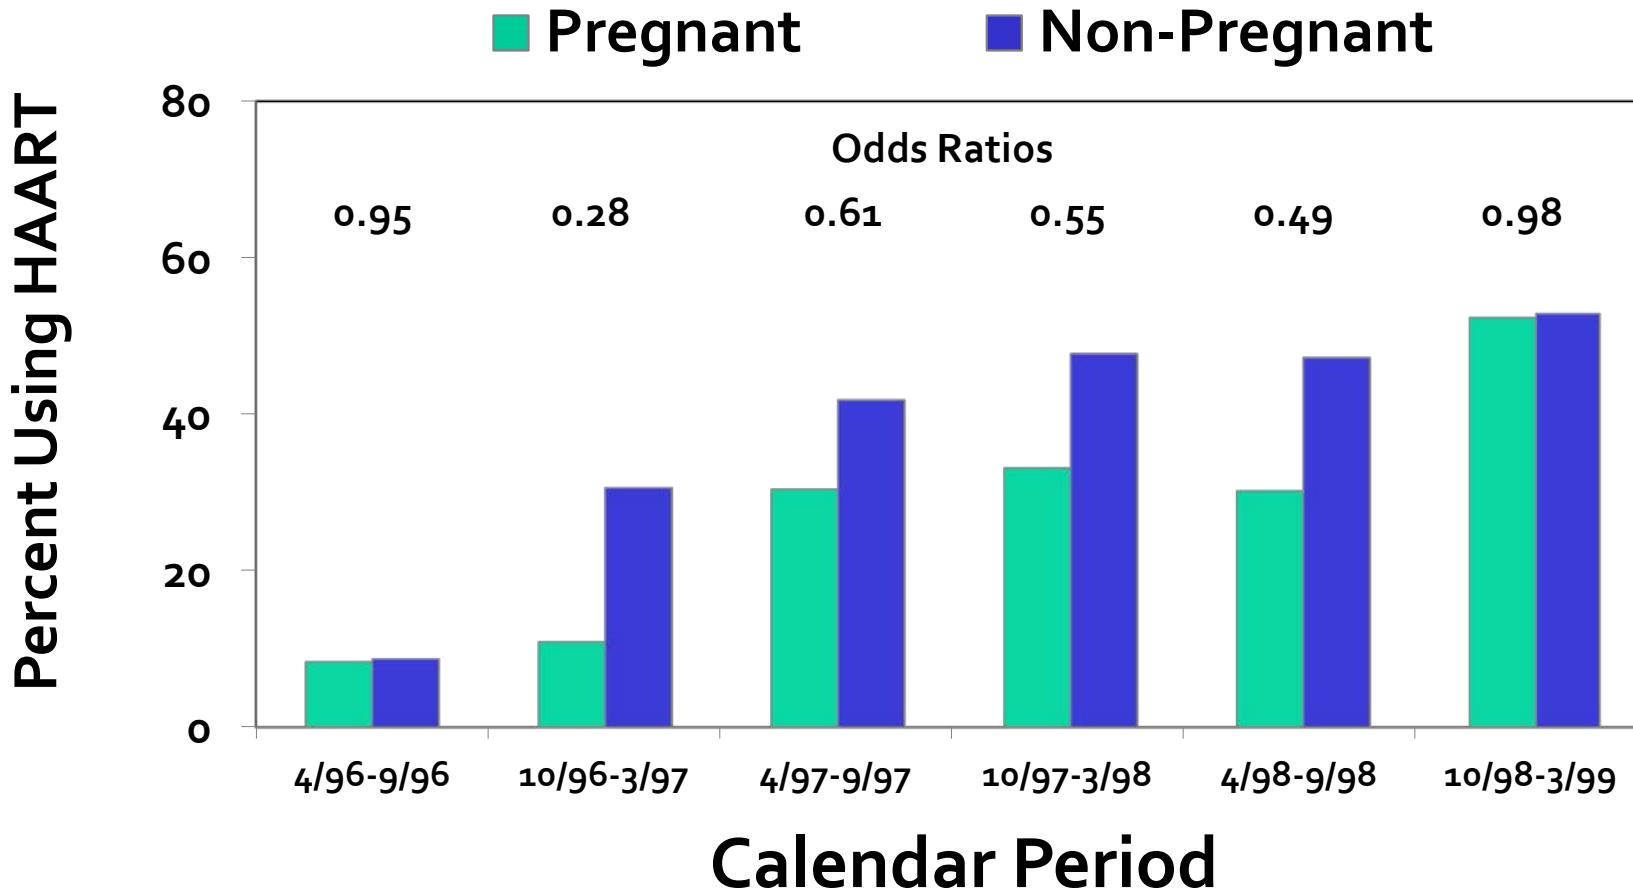

Characteristics Associated with ≥95% Adherence

(Merenstein, Schneider, . . . , Plankey, *Pediatrics* 2008; 121:e787-e793)

Characteristic	Number Person-Visits	No. (%) with ≥95% adherence	Adjusted OR	95% CI
No. children ≤18 yo living in household				
0	2817	2193 (78)	1.00	Reference
1	1402	1073 (77)	0.89	0.73 – 1.07
2	934	685 (73)	0.85	0.68 – 1.06
3	402	284 (71)	0.84	0.62 – 1.12
≥4	277	195 (70)	0.77	0.56 – 1.08
Study site				
Bronx	1188	995 (84)	1.00	Reference
Brooklyn	1093	753 (69)	0.39	0.29 – 0.53
Washington, D.C.	770	555 (72)	0.47	0.34 – 0.64
Los Angeles	1190	975 (82)	0.75	0.55 – 1.02

Chicago	877	637 (73)	0.51	0.37 – 0.70

HAART Use Among Pregnant and Non-Pregnant Women

(Minkoff, Ahdieh, . . . , Stek, *Am J Obstet Gynecol* 2001; 184:1221-1227)

Among those with $CD4 \leq 500 \mu\text{l}$ or $\text{HIV RNA} \geq 10,000 \text{ copies/ml}$.

Relative Hazard for New HPV Infection in HIV+ Women

(Minkoff, Feldman, . . . , Anastos, *JID* 2004; 189:1821-1828)

	RH (95% CI)	P
Monotherapy vs. none	0.81 (0.49 – 1.32)	0.40
Combination therapy vs. none	1.06 (0.64 – 1.75)	0.83
HAART vs. none	1.08 (0.66 – 1.77)	0.76
Oral contraceptive use (yes vs. no)	1.09 (0.69 – 1.72)	0.72
Log CD4+ cell count	0.90 (0.83 – 0.97)	0.008
Log viral load	1.06 (1.01 – 1.11)	0.01
Smoking status (yes vs. no)	1.33 (1.10 – 1.60)	0.003
Parity	1.02 (0.98 – 1.06)	0.34
No. Sex partners, recent or lifetime	0.99 (0.97 – 1.03)	0.80
Age at baseline	0.99 (0.97 – 1.00)	0.04
Age at first intercourse	1.00 (0.97 – 1.03)	0.79

Parity and age at first intercourse are fixed variables; smoking, number of sex partners, oral contraceptive use, CD4+ cell count, and viral load are time-dependent variables. 1797 women; 501 events.

Association of Crack and Cocaine Use with HPV and Cervical SIL

(Minkoff, Zhong, . . . , Burk, *Infect Dis Obstet Gynecol* 2008; 2008:587082)

Crack or Cocaine Use in Past 6 Mos. vs. No Use	Any HPV	Oncogenic HPV	Non-oncogenic HPV	SIL with Oncogenic HPV
Prevalent HPV & SIL: OR (95% CI)	1.22 (1.09-1.37)	1.30 (1.09-1.55)	1.18 (1.04-1.34)	1.70 (1.27-2.27)
Incident HPV & SIL: HR (95% CI)	1.20 (1.02-1.42)	1.21 (0.97-1.52)	1.20 (1.00-1.44)	1.51 (0.99-2.3)
Clearance of HPV & SIL: HR (95% CI)	1.02 (0.88-1.17)	0.96 (0.80-1.16)	1.05 (0.88-1.25)	0.57 (0.34-0.97)

Adjusted for CD4 count, number of sexual partners, smoking, age, and race.

Effective HAART Use and HPV Infection

(Minkoff, Zhong, . . . , Strickler, *JID* 2010; 201:681-690)

Outcome, Effectiveness	Any HPV		Oncogenic HPV	
	OR (95% CI)	P	OR (95% CI)	P
Prevalence				
Effective vs. pre-HAART	0.72 (0.60-0.87)	<.001	0.71 (0.50-1.02)	.06

Impact of CD4+ Lymphocytes and HIV Infection on AMH

(Scherzer, Bacchetti, . . . , Greenblatt, *Am J Reprod Immunol* 2015;73(3):273-284)

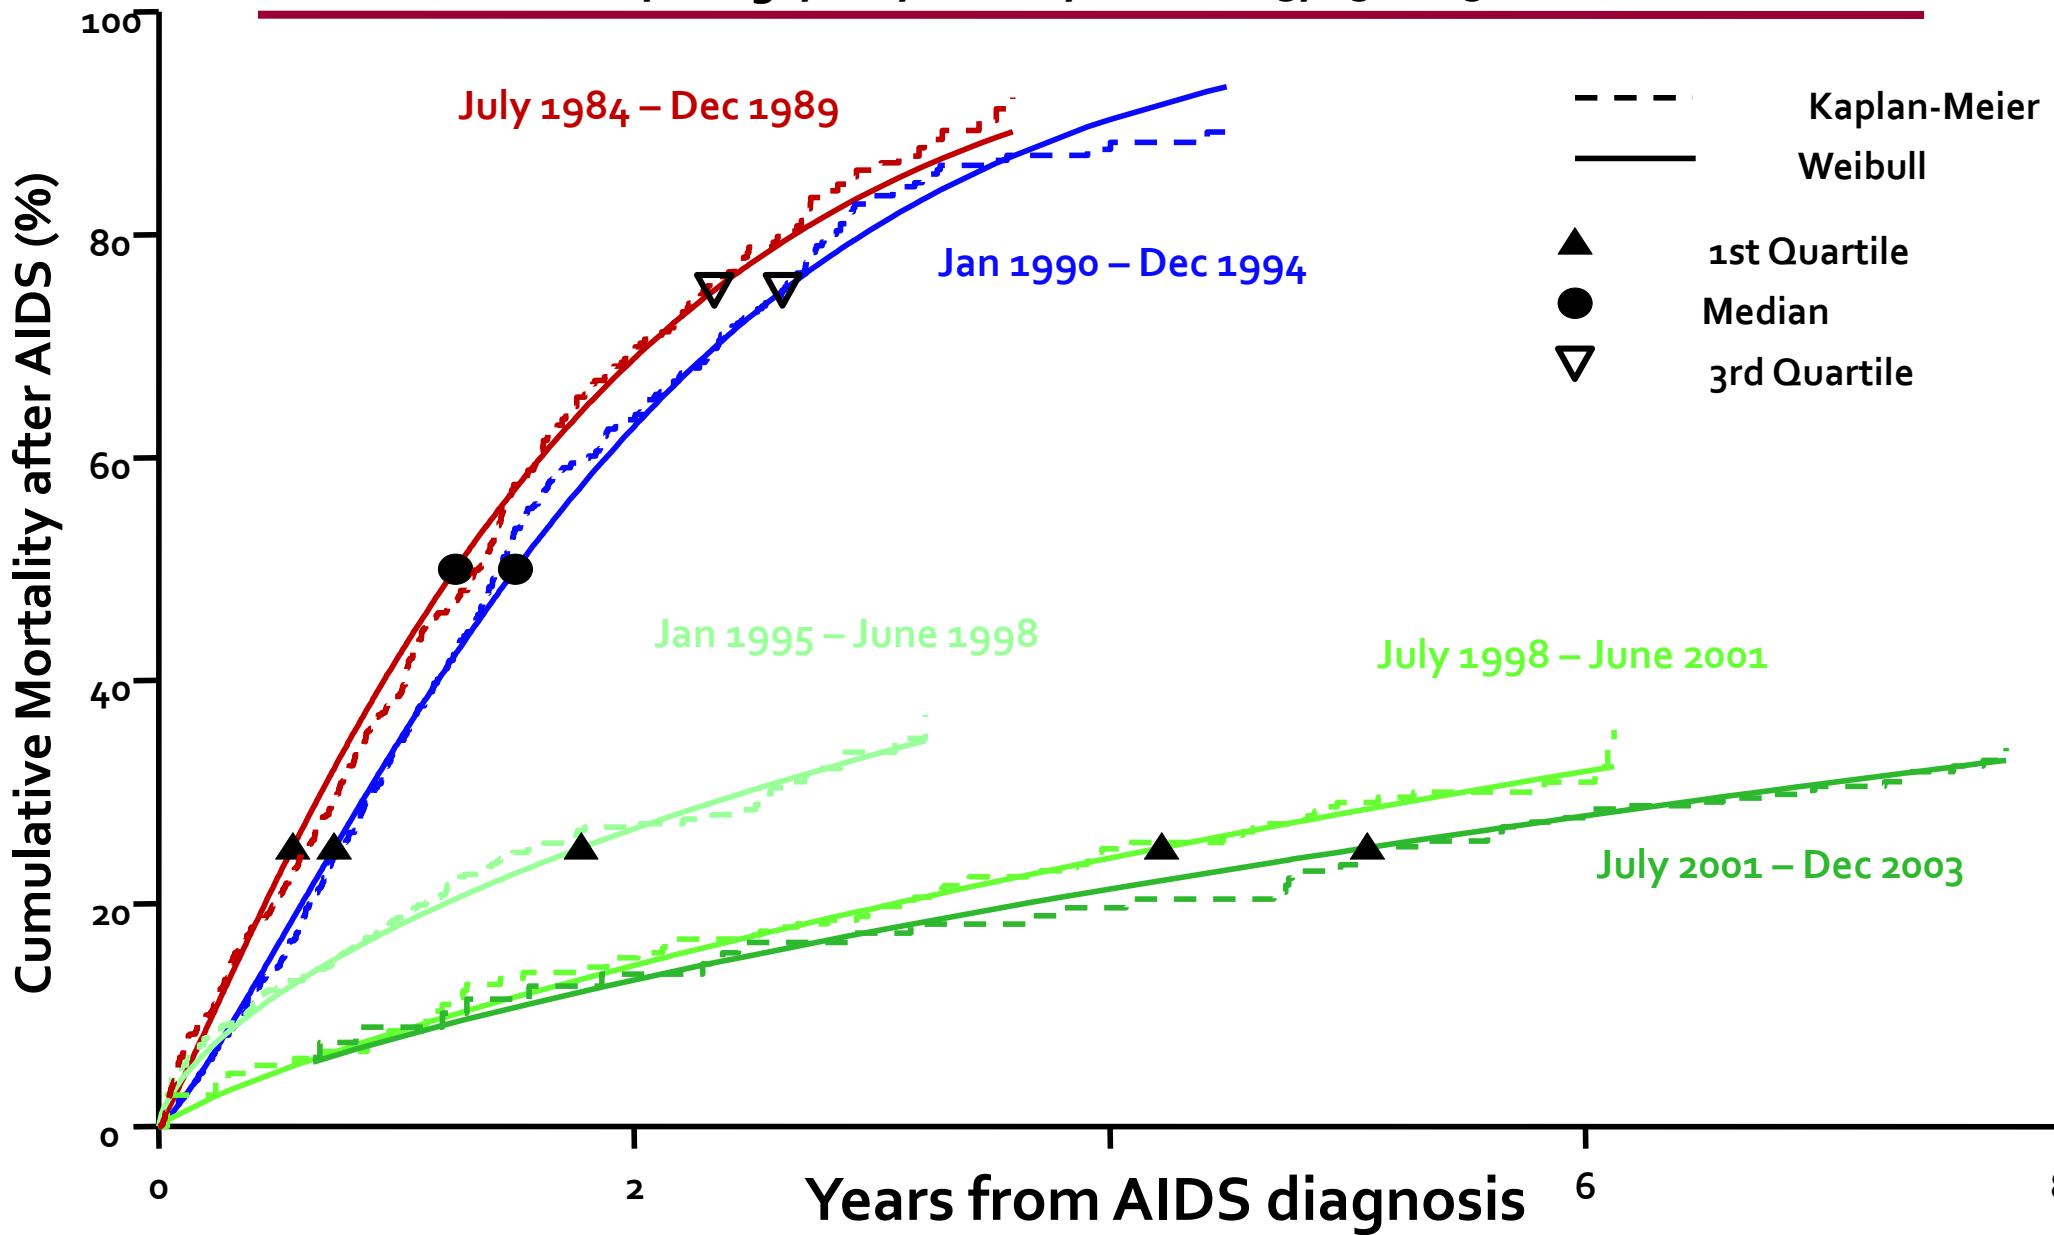

Estimated Anti-Mullerian Hormone levels at age 40 by HIV status and CD4 count

- Solid lines denote estimated level of AMH from linear piecewise model including left-censoring, with random intercept and slope to handle repeated AMH measures within a subject.
- CD4 ranges shown extend from 5th to 95th percentile for HIV-infected and uninfected participants separately.
- Dotted lines indicate 95% confidence bands. Model controls for age, HIV status, and CD4 count.

HPV-16 Seropositivity and Pap Smear Results in HERS and WIHS

(Viscidi, Ahdieh-Grant, . . . , Miotti, *JID* 2003; 187:194-205)

HPV group, Pap smear finding	WIHS ^a		HERS ^b	
	No. of subjects	% subjects w/ HPV-16 antibodies	No. of subjects	% subjects w/ HPV-16 antibodies
HPV-16 DNA+				
Normal/ASCUS	63	56%	29	52%
LSIL/HSIL	35	60%	25	68%
<i>P</i>		.67		.22
HPV-16 DNA-				
Normal/ASCUS	1831	49%	895	53%
LSIL/HSIL	270	60%	126	66%
<i>P</i>		.001		.006

^a Of the 2257 women in WIHS with decisive PCR results, 58 did not have Pap smear results.

^b Of the 1206 women in HERS with decisive PCR results, 131 did not have Pap smear results.

Cause-Specific Life Expectancies After 35 Years of Age for HIV+ and HIV- Individuals Followed Simultaneously in Long-term Cohort Studies, 1984-2008

(Wada, Jacobson, . . . , Muñoz, *Am J Epidemiol* 2013;177(2):116-125)

Estimated Proportions of Mortality, Location Parameters, Scale Parameters, and Median Ages at Death From Weibull Mixture Models Comparing the Pre- and Post-Highly Active Antiretroviral Therapy Eras^a Among Multicenter AIDS Cohort Study Participants^b, 1984-2008

Mortality Category	Proportion of Mortality, %	95% CI	Location Parameter	95% CI	Scale Parameter	95% CI	Median Age, years ^b
HIV-negative, 1984-2008 Pre-HAART era (reference)	N/A	N/A	3.73	3.71, 3.75	0.25	0.24, 0.26	73.1.
Non-AIDS mortality	6	5, 8	2.84	2.63, 3.04	0.53	0.41, 0.66	49.0
AIDS-mortality	94	92, 95	2.34	2.29, 2.40	0.83	0.79, 0.87	42.7
HAART era							
Non-AIDS mortality	53*	48, 59	3.57*	3.52, 3.62	0.37*	0.34, 0.40	66.0*
AIDS-mortality	47*	41, 52	2.86*	2.70, 3.01	0.75	0.68, 0.83	48.2*

Abbreviations: AIDS, acquired immune deficiency syndrome; CI, confidence interval; HAART, highly active antiretroviral therapy; HIV, human immunodeficiency virus; MACS, Multicenter AIDS Cohort Study; N/A, not applicable.

* $P < 0.05$ for difference relative to pre-HAART era

^aPre-HAART era: 1984-1995; HAART era: 1996-2008

^bTime origin is age 35 years. For HIV-negative individuals, survival times were modeled as Weibull (β , σ). For HIV-positive individuals, survival times were modeled as a mixture with the proportion who died of non-AIDS causes (π) as Weibull (location (β_1), scale (σ_1)) and the complement (1 - π) who died of AIDS as Weibull (β_2 , σ_2).

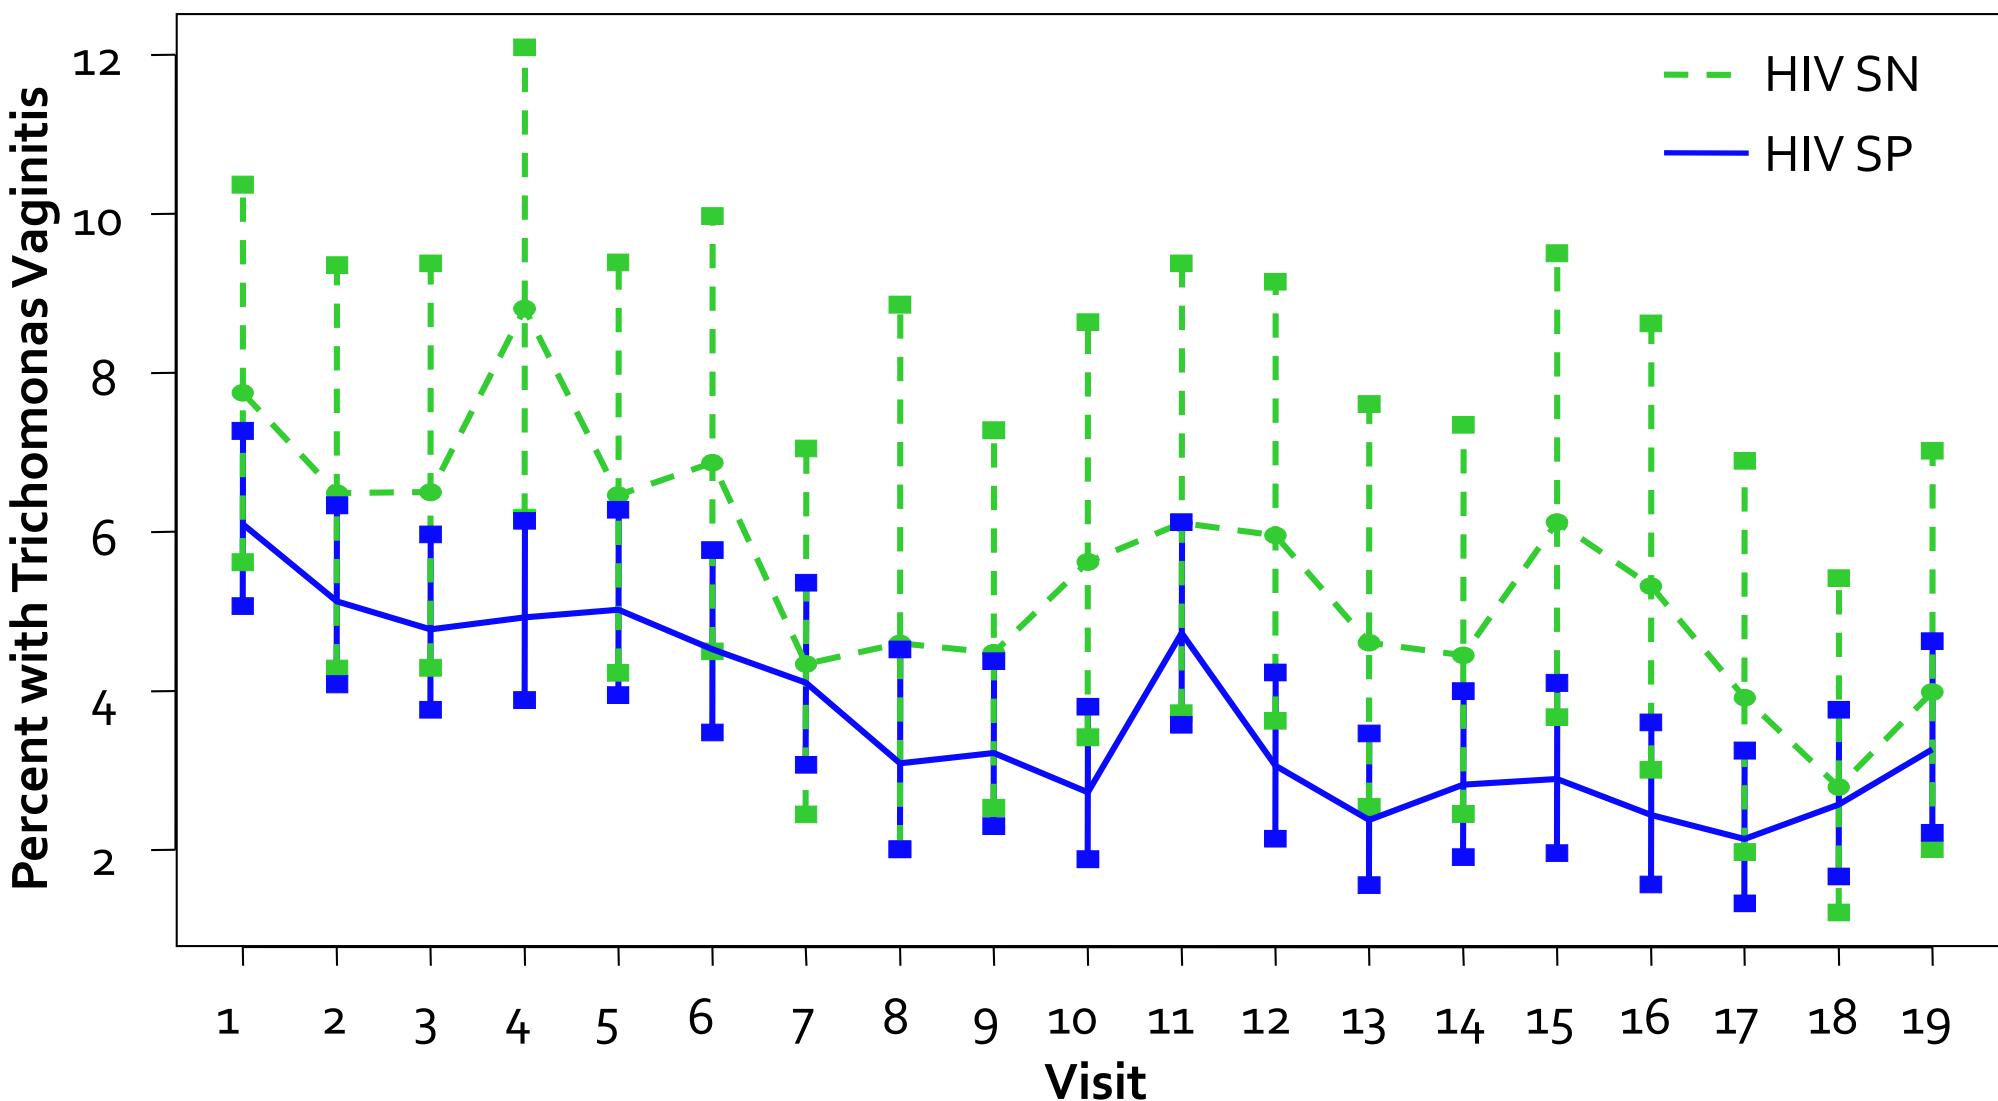

Factors Associated with Incident HPV

(Watts, Fazari, . . . , Strickler, *JID* 2005; 191:1129-1139)

Factor	Adjusted Odds Ratio
# of current male partners (Reference = No partners)	
One	1.31 (1.14-1.50)
More than one	1.59 (1.35-1.88)
Current smoking (Reference = No smoking)	1.96 (1.75-2.20)
HIV / CD4+ cell count (Reference = HIV-negative)	
HIV+ and CD4 ⁺ > 500 cells/mm ³	2.12 (1.73-2.60)
HIV+ and 500 ≥ CD4 ⁺ > 200 cells/mm ³	3.61 (3.01-4.32)
HIV+ and CD4 ⁺ ≤ 200 cells/mm ³	5.19 (4.30-6.26)
Vaginal Gram stain (Reference = Normal)	
Intermediate	1.23 (1.07-1.41)
Bacterial vaginosis	1.41 (1.25-1.59)
<i>Trichomonas vaginalis</i>	1.36 (1.14-1.62)

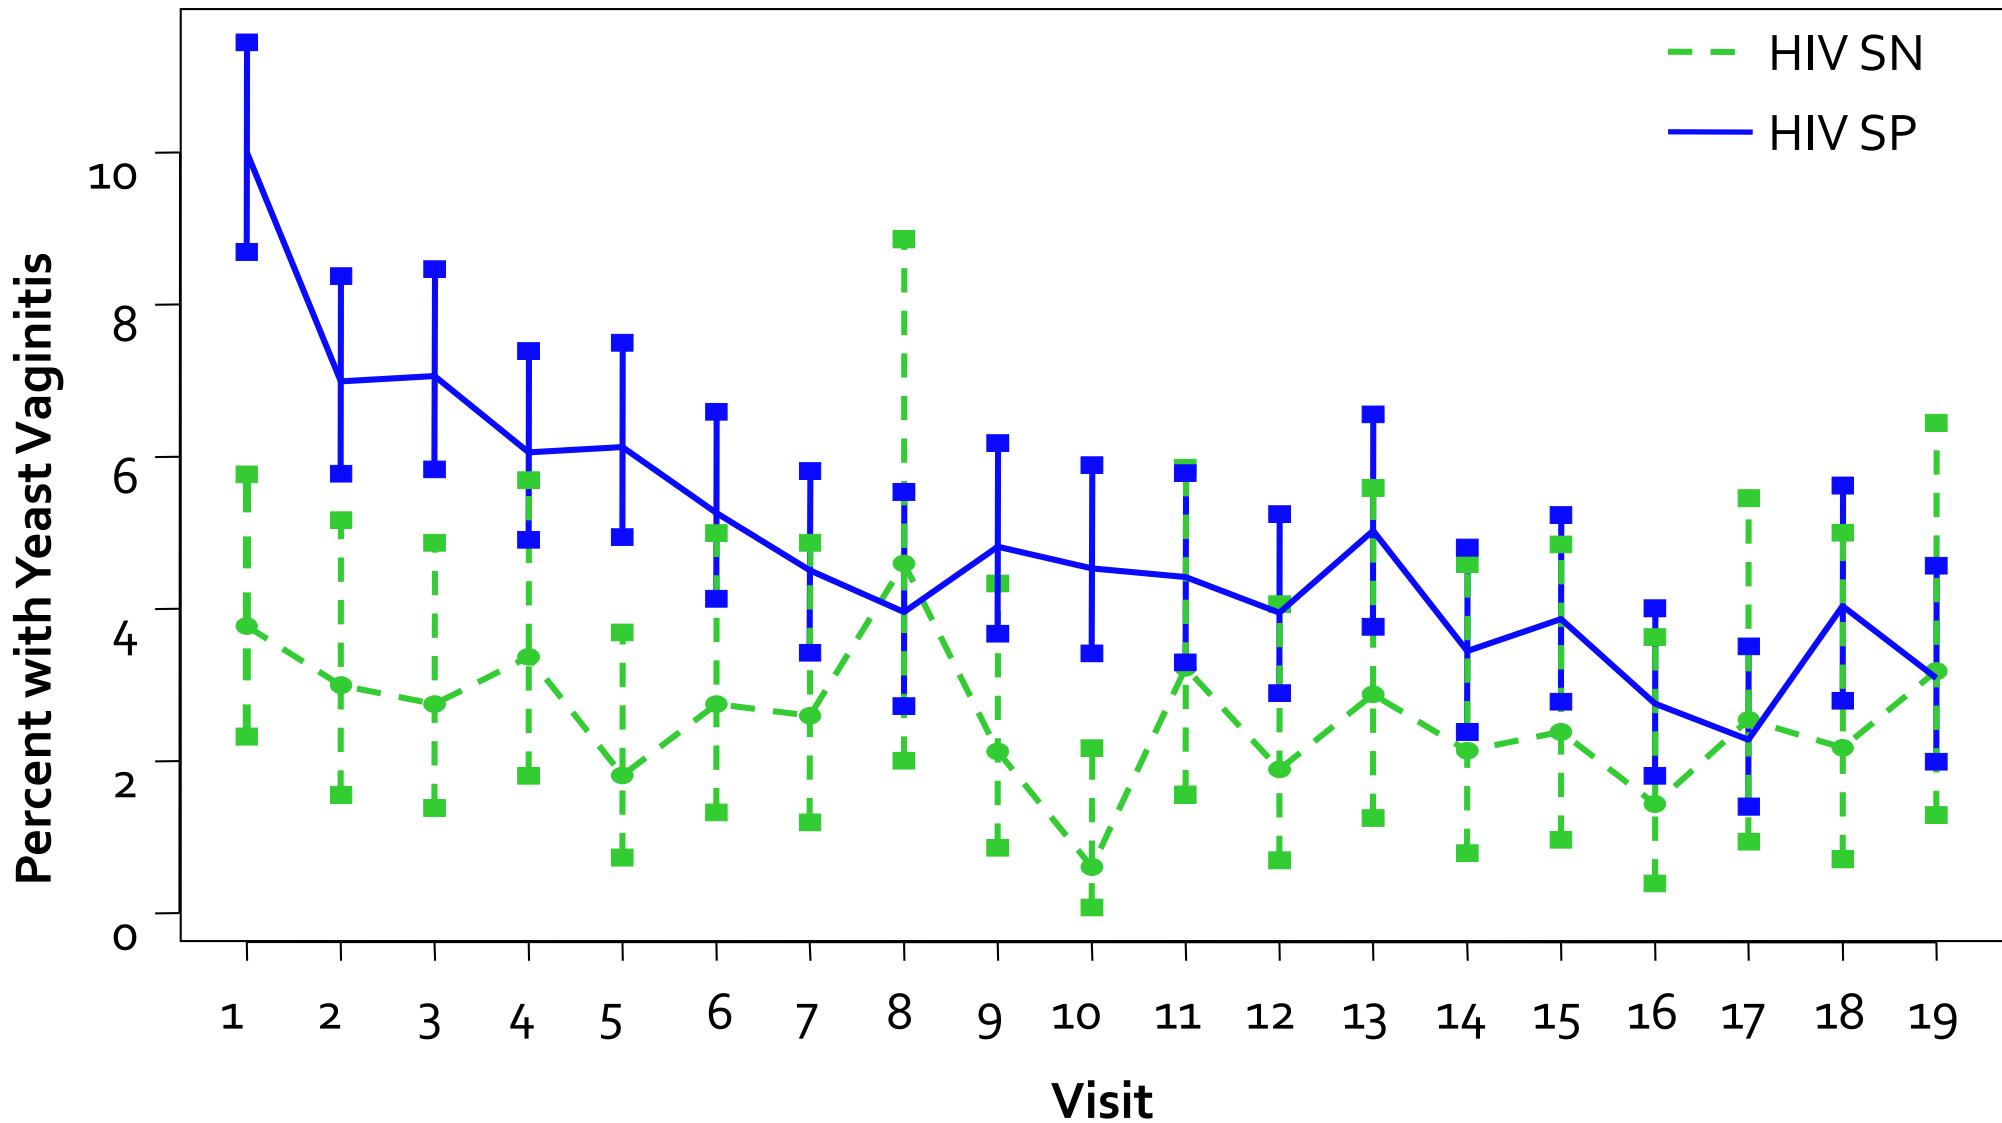

Prevalence of Clinical Trichomonas Vaginitis by Wet Mount

(Watts, Springer, . . . , Greenblatt, *J Acquir Immune Defic Syndr* 2006; 43:161-168)

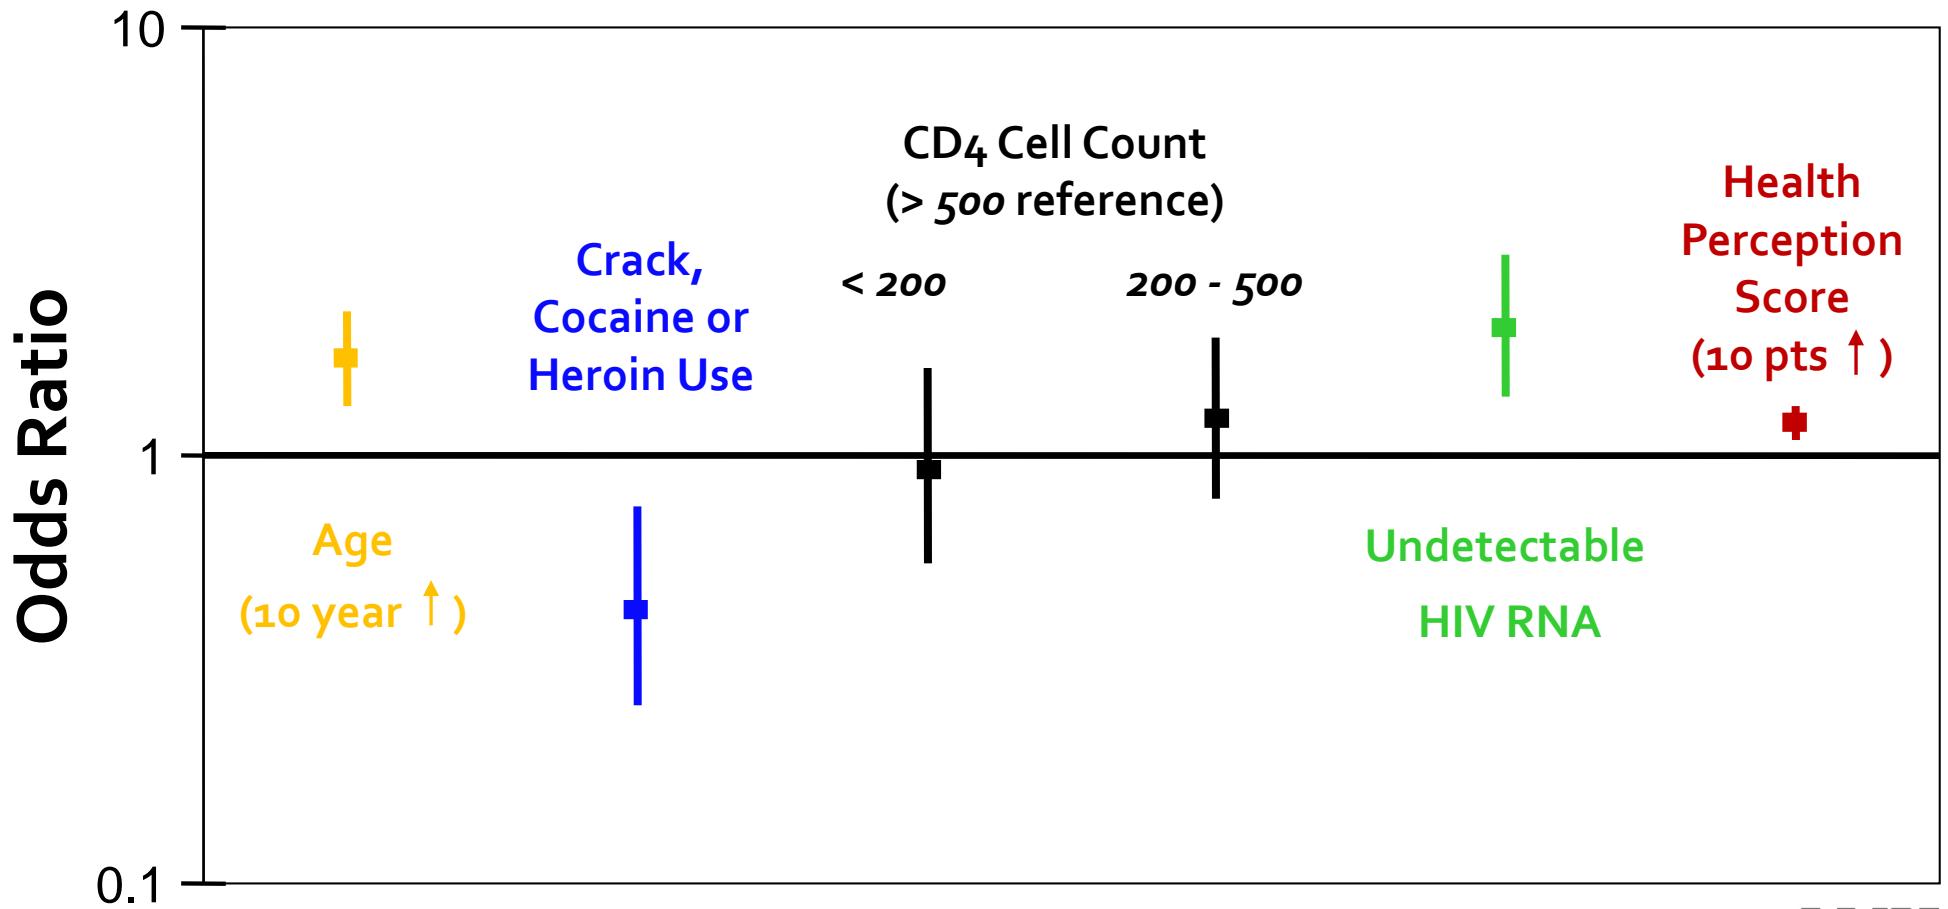

Prevalence of Symptomatic Candida (Yeast Vaginitis)

(Watts, Springer, . . . , Greenblatt, *J Acquir Immune Defic Syndr* 2006; 43:161-168)

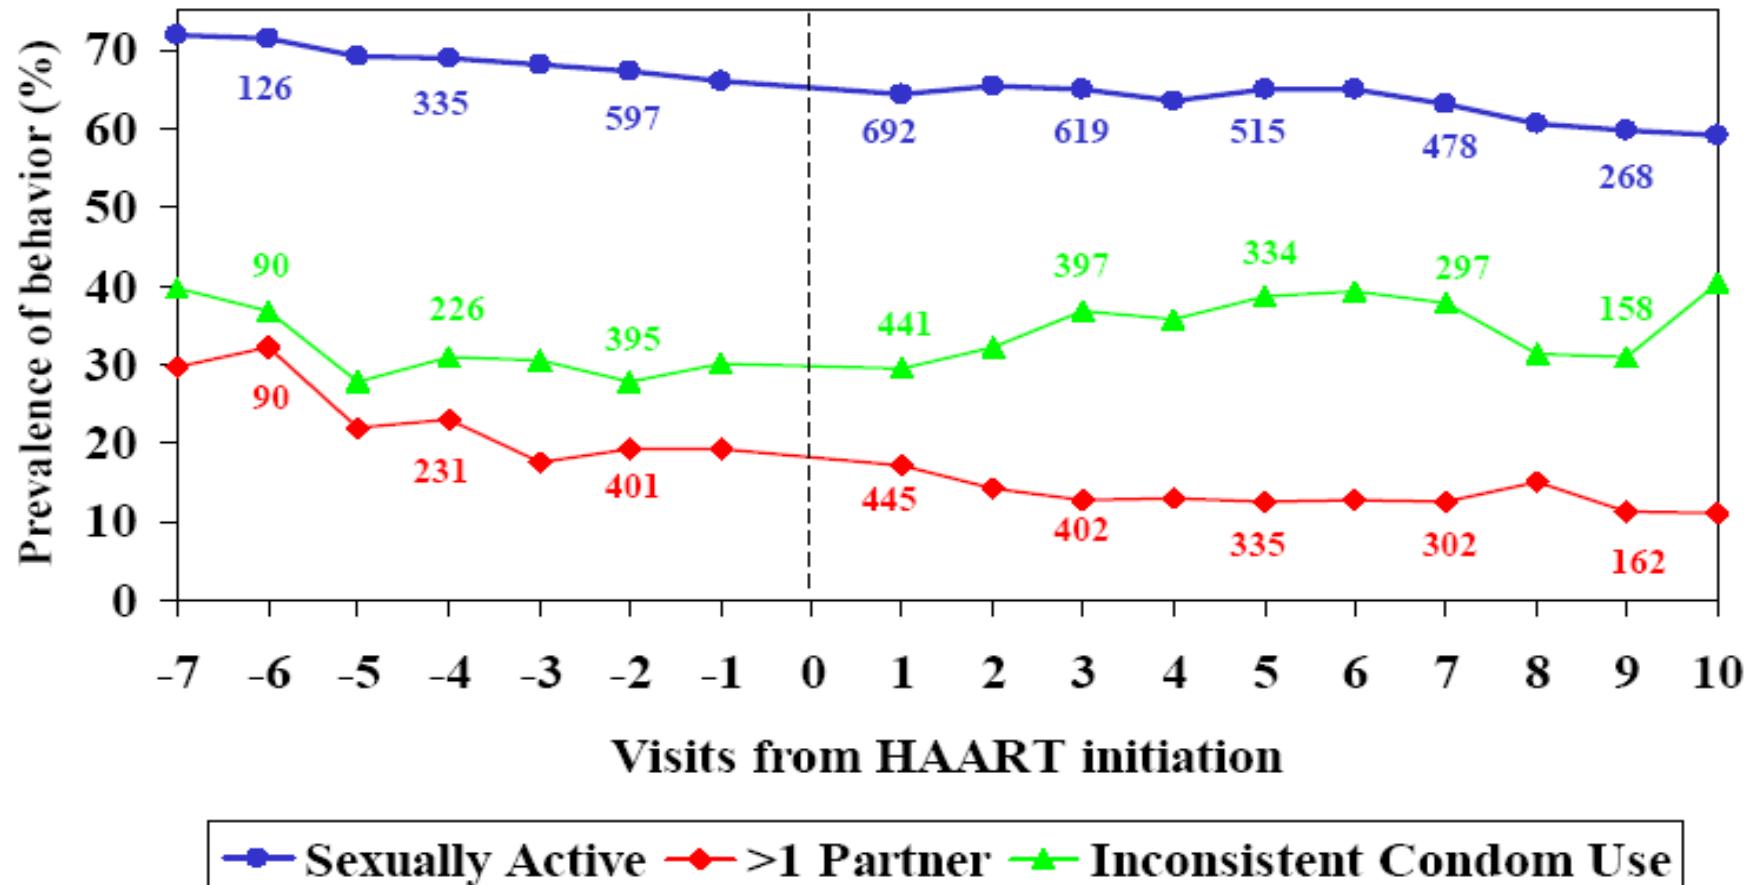

Correlates of ART Adherence in the Women's Interagency HIV Study

(Wilson, Barrón, . . . , Young, *Clin Infect Dis* 2002; 34:529-534)

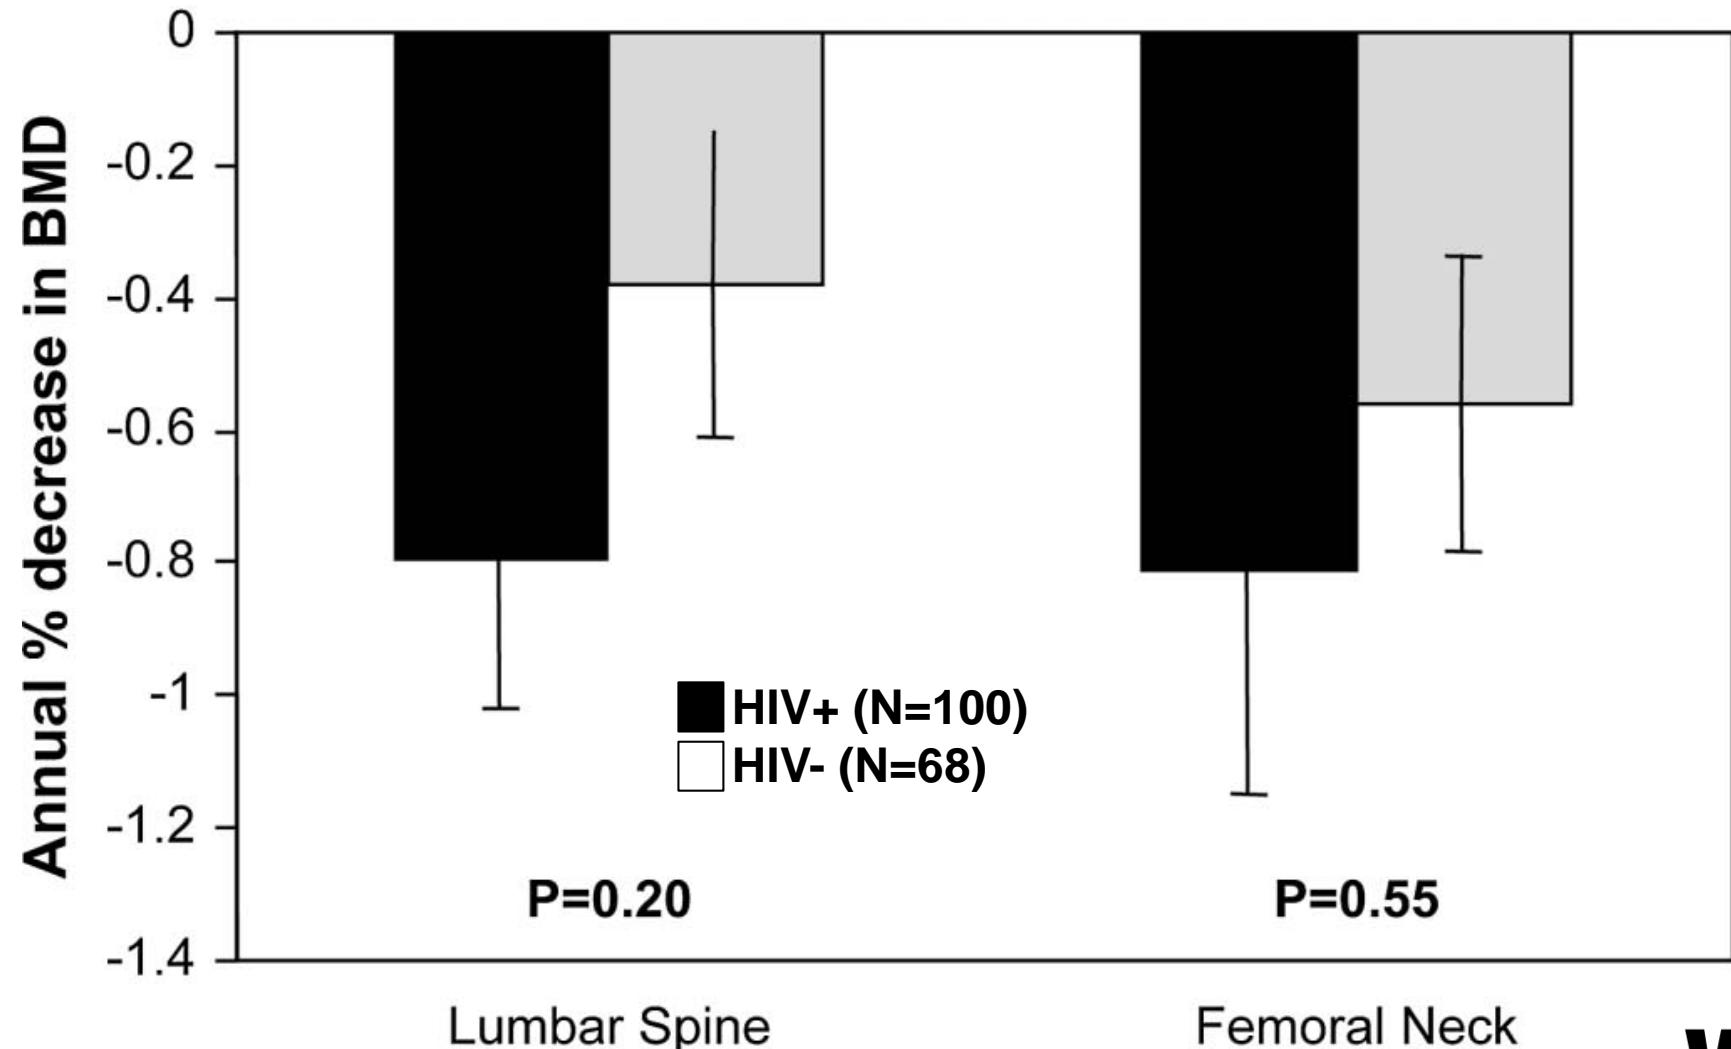

Changes in Sexual Behavior Among HIV+ Women After Initiation of HAART

(Wilson, Gore, . . . , Gange, Am J Public Health 2004; 94:1141-1146)

Annual Percent Decrease in Bone Mineral Density

(Yin, Lu, . . . , Anastos, *J Acquir Immune Defic Syndr* 2010; 53:202-208)

P-values are for comparison between HIV+ and HIV- groups
