CRST 0405a Changes List

1. Removed questions referring to amount of refrigerant upon shipment and arrival.

2. Added prompt to remind the lab to report the shipment tracking number to the repository.

3. Box ID range is not entered into Apollo due to site-specific variability however labs should record this on the form for reference with correspondence with the repository.

4. New question that asks the site to record how many files they sent to the repository for the shipment. (*For example, if a manifest was sent for each individual box in the shipment and the shipment had 24 boxes, then 24 files should have been sent.*)

5. The form now captures Discrepancy reports via a subform that should be completed for each data entry batch submitted by the repository.

6. New question that asks the site to record how many data entry batch numbers were reported by the repository. The form allows for the first two potential discrepancy reports in a standard subform. Page 5 starts the manually numbered subforms for discrepancy reports after the second one. This page can be copied if there are many discrepancy reports.

7. Only the FIRST date a Site received an Inventory/Discrepancy report and the LAST date a Site sent Corrective Action to the Repository.
