

PK06 – visit 22
Version 04/01/05

1. Question A6, instructions: Add clarification as to which antiretroviral doses should be recorded on this form: “DO NOT record antiretroviral doses taken throughout the entire day of PK testing, only those taken at the time PK sampling is started.”
2. Question A6: Reformat section for recording observed antiretroviral medication ingestion. For each medication taken at the time PK sampling is started, interviewer/clinician will need to record (in b) the number of capsules or tablets or mL taken. The actual pill formulation/dose or liquid formulation/dose will be recorded (in c), as well.
3. Because the formulation/dose data collected for different medications now differs, data can no longer be entered into a repeating segment. Thus, new variables were created for entry of each individual question on the form. Data entry staff will have to enter “yes” or “no” for each medication listed on the form.
4. Delete “hydroxyurea” and fields to record “other antiviral” from the form. Data for these medications will no longer be recorded on PK06.
